

# Pythagoras Theorem

-  Squaring a Number and Square Roots
-  Investigating Pythagoras Theorem
-  Calculating the Hypotenuse
-  Solving real-life problems
-  Finding the length of the smaller side
-  Distance between two points
-  Mixed problems

# Squaring a Number

## Learning Intention

1. To understand the term 'squaring a number'.

## Success Criteria

1. To understand what is meant by the term 'squaring a number'
2. Be able to calculate squares both mentally and using the calculator.

# Squaring a Number

To square a number means to :  
"Multiply it by itself"

Example :

$$9^2 \text{ means } 9 \times 9 = 81$$

$$10^2 \text{ means } 10 \times 10 = 100$$

# Square Root of a number

You now know how to find :  $9^2 = 9 \times 9 = 81$

We can 'undo' this by asking

"which number, times itself, gives 81"

From the top line, the answer is 9

This is expressed as : "the SQUARE ROOT of 81 is 9"

or in symbols we write :  $\sqrt{81} = 9$

# Right - Angle Triangles

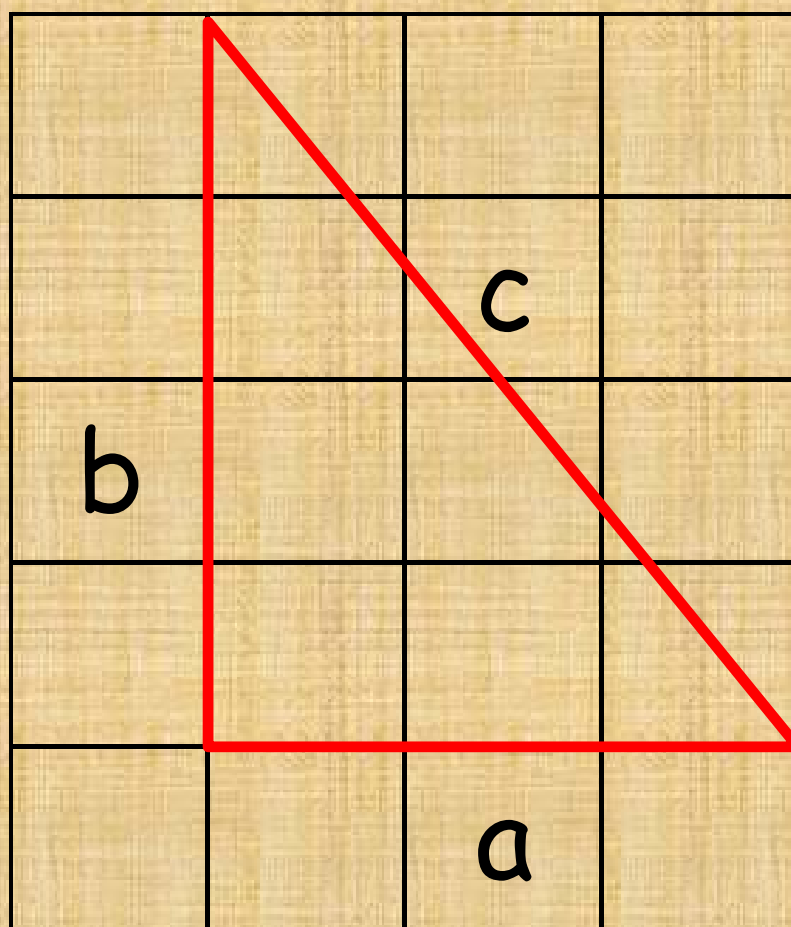

## Aim of today's Lesson

'To investigate the right-angle triangle and to come up with a relationship between the lengths of its two shorter sides and the longest side which is called the hypotenuse.'

# Right - Angle Triangles

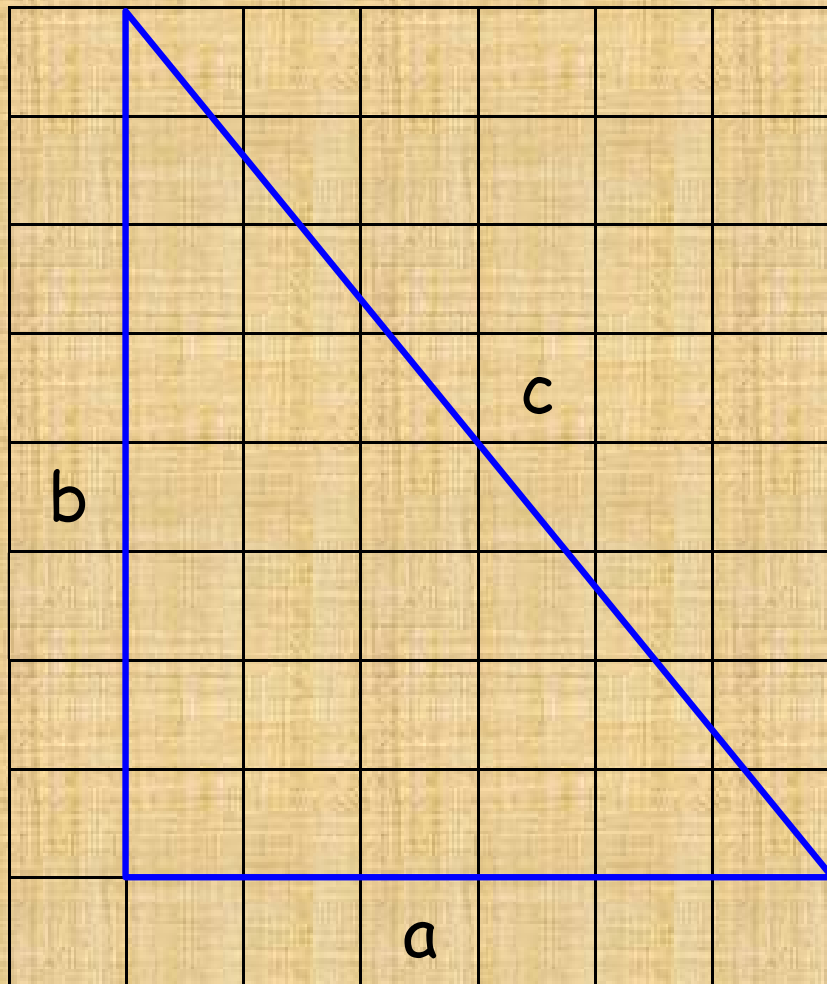

What is the length of **a** ? **3**

What is the length of **b** ? **4**

Copy the triangle into your jotter  
and measure the length of **c**

**5**

# Right - Angle Triangles

What is the length of **a** ? **6**

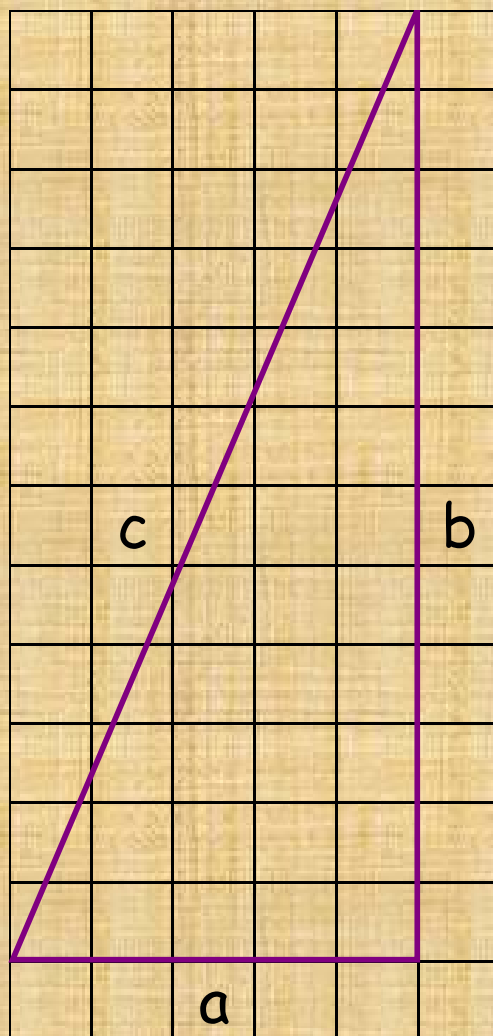

What is the length of **b** ? **8**

Copy the triangle into your jotter  
and measure the length of **c**

**10**

# Right - Angle Triangles

What is the length of **a** ? **5**

What is the length of **b** ? **12**

Copy the triangle into your jotter  
and measure the length of **c**

**13**

# Right - Angle Triangles

Copy the table below and fill in the values that are missing

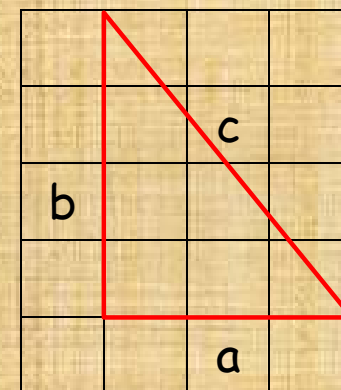

a	b	c	$a^2$	$b^2$	$c^2$
3	4	5			
5	12	13			
6	8	10			

# Right - Angle Triangles

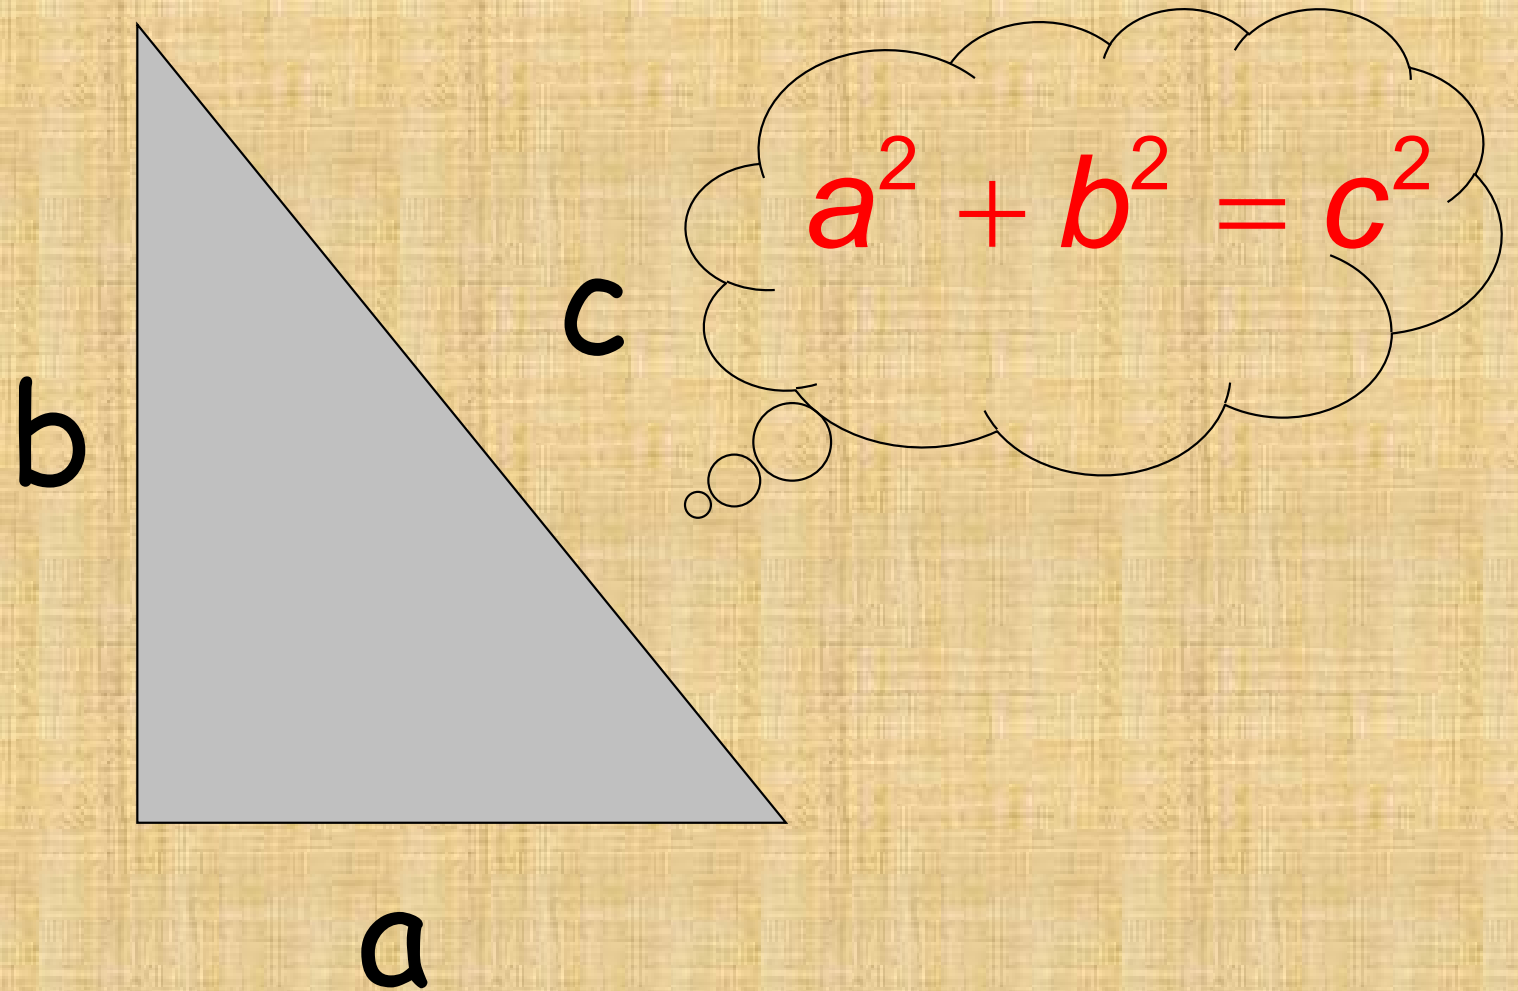

Can anyone spot a relationship between  $a^2$ ,  $b^2$ ,  $c^2$ .

a	b	c	$a^2$	$b^2$	$c^2$
3	4	5	9	16	25
5	12	13	25	144	169
6	8	10	36	64	100

$$a^2 + b^2 = c^2$$

# Pythagoras's Theorem

# Summary of Pythagoras's Theorem

$$a^2 + b^2 = c^2$$

**Note:** The equation is ONLY valid  
for right-angled triangles.

# Calculating Hypotenuse

## Learning Intention

1. Use Pythagoras Theorem to calculate the length of the hypotenuse  
"the longest side"

## Success Criteria

1. Know the term hypotenuse  
"the longest side"
2. Use Pythagoras Theorem to calculate the hypotenuse.

# Calculating the Hypotenuse

## Example 1

Q2. Calculate the longest length of the right-angled triangle below.

$$c^2 = a^2 + b^2$$

$$c^2 = 12^2 + 8^2$$

$$c^2 = 208$$

$$c = \sqrt{208} = 14.42\text{km}$$

# Calculating the Hypotenuse

## Example 2

Q1. An aeroplane is preparing to land at Glasgow Airport. It is over Lennoxtown at present which is 15km from the airport. It is at a height of 8km.

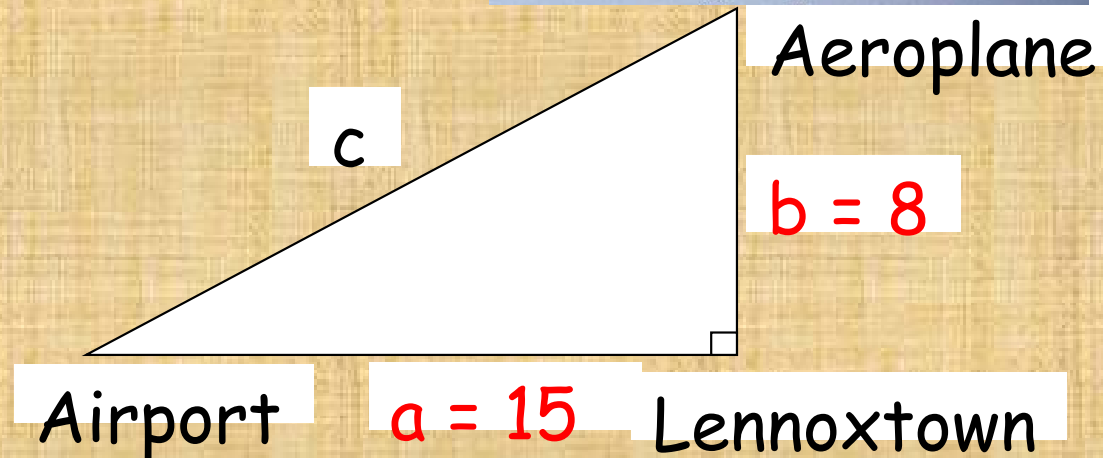

How far away is the plane from the airport?

$$c^2 = a^2 + b^2$$

$$c^2 = 15^2 + 8^2$$

$$c^2 = 289$$

$$c = \sqrt{289} = 17\text{km}$$

# Solving Real-Life Problems

## Learning Intention

1. To show how Pythagoras Theorem can be used to solve real-life problems.

## Success Criteria

1. Solve real-life problems using Pythagoras Theorem.

# Solving Real-Life Problems

When coming across a problem involving finding a missing side in a right-angled triangle, you should consider using Pythagoras' Theorem to calculate its length.

Example :

A steel rod is used to support a tree which is in danger of falling down.

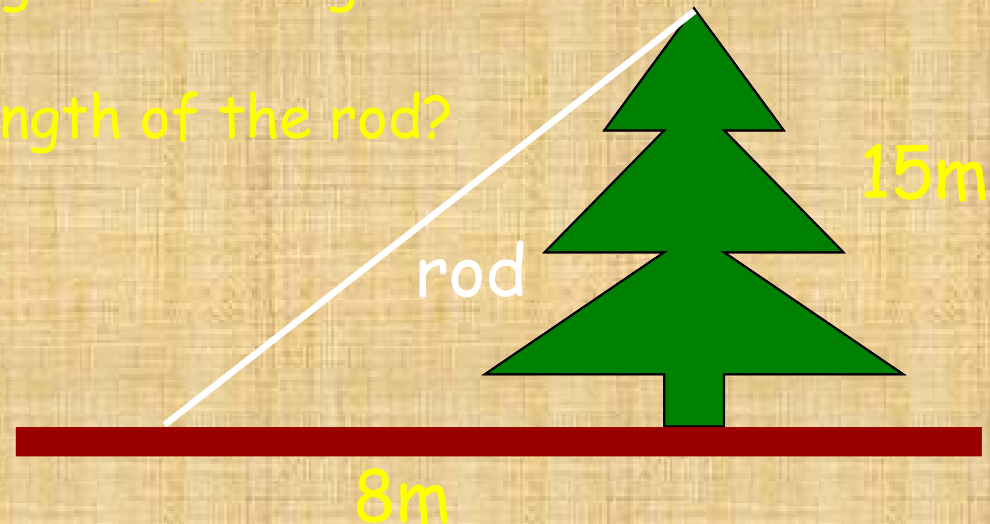

$$c^2 = a^2 + b^2$$

$$c^2 = 8^2 + 15^2$$

$$c^2 = 289$$

$$c = \sqrt{289} = 17\text{m}$$

What is the length of the rod?

# Solving Real-Life Problems

## Example 2

A garden is rectangular in shape. A fence is to be put along the diagonal as shown below. What is the length of the fence.

$$c^2 = a^2 + b^2$$

$$c^2 = 10^2 + 15^2$$

$$c^2 = 325$$

$$c = \sqrt{325} = 18.03\text{m}$$

10m

15m

# Length of the smaller side

## Learning Intention

1. To show how Pythagoras Theorem can be used to find the length of the smaller side.

## Success Criteria

1. Use Pythagoras Theorem to find the length of smaller side.

# Length of the smaller side

To find the length of the smaller side of a right-angled triangle we simply rearrange Pythagoras Theorem.

Example : Find the length of side a ?

$$c^2 = a^2 + b^2$$

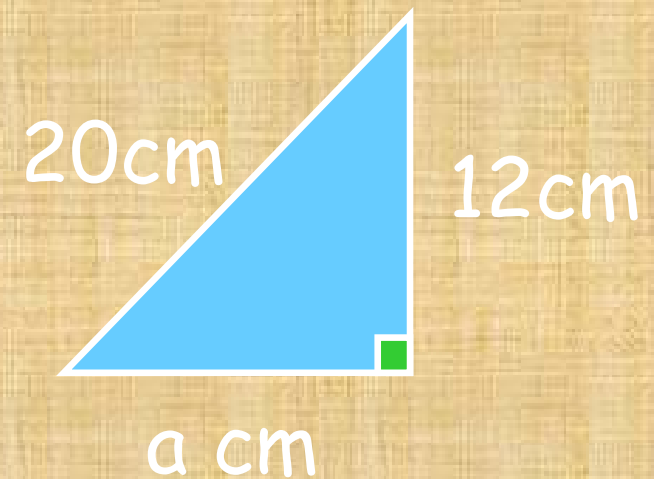

$$a^2 = c^2 - b^2$$

$$a^2 = 20^2 - 12^2$$

$$a^2 = 256$$

$$a = \sqrt{256} = 16\text{cm}$$

Check  
answer!  
Always  
smaller than  
hypotenuse

# Length of the smaller side

Example : Find the length of side b ?

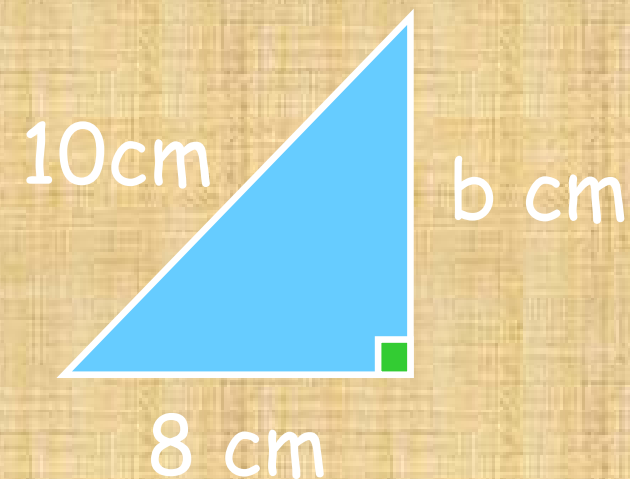

$$c^2 = a^2 + b^2$$

$$b^2 = c^2 - a^2$$

$$b^2 = 10^2 - 8^2$$

$$b^2 = 36$$

$$b = \sqrt{36} = 6\text{cm}$$

Check  
answer!  
Always  
smaller than  
hypotenuse

# Starter Questions

ALWAYS  
comes up in  
exam !!

In a restaurant, tables and chairs are set out as shown below.

1 table

2 tables

3 tables

(a) Complete this table.

Number of tables	1	2	3	4	5	6		13
Number of chairs	4	6						

(b) Write down a rule for finding the number of chairs if you know the number of tables.

# Finding the Length of a Line

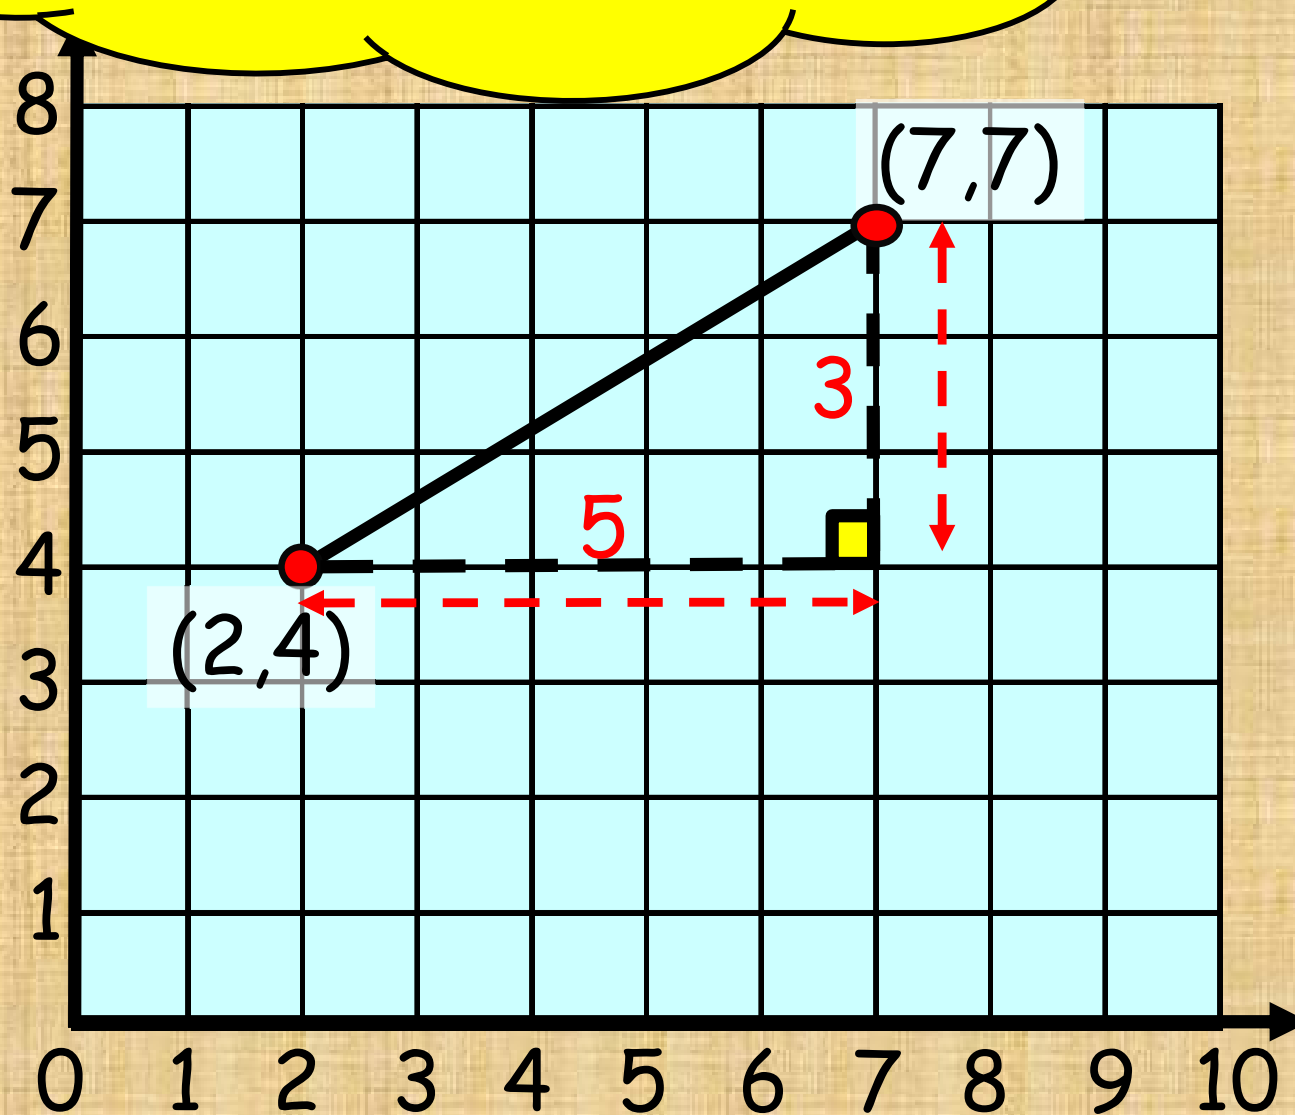

## Learning Intention

1. To show how Pythagoras Theorem can be used to find the length of a line.

## Success Criteria

1. Apply Pythagoras Theorem to find length of a line.
2. Show all working.

Discuss with your partner  
how we might find the  
length of the line.

$$c^2 = a^2 + b^2$$

$$c^2 = 5^2 + 3^2$$

$$c = \sqrt{25 + 9}$$

$$c = \sqrt{34}$$

$$c = 5.83$$

# Pythagoras Theorem to find the length of a Line

$$c^2 = a^2 + b^2$$

$$c^2 = 5^2 + 9^2$$

$$c = \sqrt{25 + 81}$$

$$c = \sqrt{106}$$

$$c = 10.3$$

# Pythagoras Theorem

## Learning Intention

1. To use knowledge already gained on Pythagoras Theorem to solve mixed problems using appropriate version of Theorem.

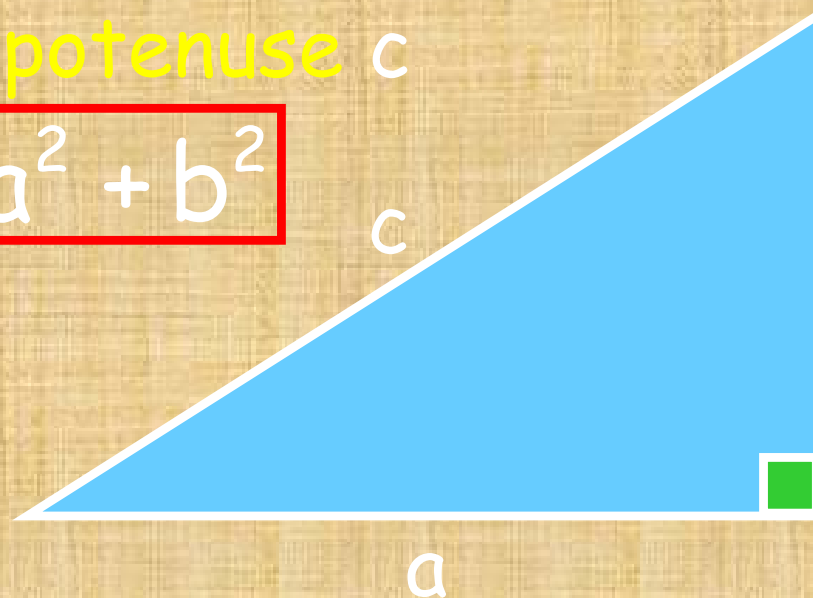

## Success Criteria

1. Use the appropriate form Pythagoras Theorem to solving problems.

# Pythagoras Theorem

Finding hypotenuse  $c$

$$c^2 = a^2 + b^2$$

Finding shorter side  $b$

$$b^2 = c^2 - a^2$$

Finding shorter side  $a$

$$a^2 = c^2 - b^2$$
