TRIGONOMETRY [[S. 3 Mathematics Notes. Copy and Practice
Ratios (sines, cosines and tangents) of angles less than $90^{\circ}$
Triangle $A B C$ is right angled at $B$

$\operatorname{Sin} A=\frac{o p p}{H y p}=\frac{B C}{A C}$
$\cos \mathrm{A}=\frac{A d j}{H y p}=\frac{A B}{A C}$
$\operatorname{Tan} \mathrm{A} \frac{O p p}{A d j}-\frac{P C}{A B} \frac{\operatorname{st} A}{\operatorname{Cos} A}$
We can remember the ratios by using SOH-CAH-TOAwhich can be thought of as the first letters of the words representing the sides of the triangle.

Reading tables
Using the 4 -figured tables, find the sine, cosine and tangent of:

$$
\begin{array}{llll}
\text { 1) } 60^{\circ} & \text { i) } 40^{\circ} & \text { in } 55 \text { i) } 73^{\circ} & \text { v) } 50^{\circ}
\end{array} \text { vi) } 30^{\circ}
$$

For any right angled triangle, the cosine of an angle is equal to the sine of its complementary angle.
l.e. $\operatorname{Cos} A=\operatorname{Sin}(90-A)$

Sine $A=\operatorname{Cos}(90-A)$
Note that $\operatorname{Cos} 50=\operatorname{Sin} 40^{\circ}$
$\operatorname{Cos} 4 O=\operatorname{Sin} 50^{\circ}$
The special angles; $\underline{\mathbf{O}}, \underline{30}, \underline{45^{\circ}}, \underline{60}, \underline{90^{\circ}}$
The angles have exact ratios
The ratios of $0^{\circ}$
Angle is $0^{\circ}$, when opposite $=$ zero and adjacent= Hypotenuse.
$\operatorname{Cos} 0^{\circ}=1$
$\sin 0^{\circ}=0$
$\operatorname{Tan} 0^{\circ}=0$
The ratios of $90^{\circ}$
Angle is $90^{\circ}$, when adjacent = zero and opposite = Hypotenuse
$\operatorname{Cos} 90^{\circ}=0$
$\operatorname{Sin} 90^{\circ}=1$
$\left.\operatorname{Tan} 90^{\circ}\right)>6$
The ratios of $45^{\circ}$
$x=1+1$
$x=2$

Triangle $A B C$ is an isosceles triangle which angle $B=90^{\circ}$, and angle $A=$ angle $C=45^{\circ}$
$\operatorname{Cos} 45^{\circ}=\frac{1}{2}-\frac{2}{2}$
$\sin 45^{\circ}=\frac{-1}{2}-\frac{2}{2}$
$\operatorname{Tan} 45^{\circ}=1$

## The ratios of $60^{\circ}$ and $30^{\circ}$

Use an equilateral triangle of sides equal to 2 units with a perpendicular bisector of $B C$ from $A$. The perpendicular bisector of $B C$ also bisects angle $A$.

Ratios of $60^{\circ}$
$\cos 60^{\circ}=\frac{t}{2}$
$\sin 60^{\circ}-\frac{Y^{\circ}}{2}$
$\operatorname{Tan} 60^{\circ}=[3$
Ratios of $30^{\circ}$
$\cos 30^{\circ} 8_{2}^{\circ}$
$\sin 30^{\circ}=\frac{t}{2}$
$\operatorname{Tan} 30^{\circ}=\frac{1}{\sqrt{3}}=\frac{\sqrt{3}}{3}$

| Angle A | $0^{\circ}$ | $30^{\circ}$ | $45^{\circ}$ | $60^{\circ}$ | $90^{\circ}$ |
| :--- | :--- | :---: | :---: | :---: | :--- |
| $\operatorname{Cos} A$ | 1 | $\mathbf{5 \%}$ | $\mathbf{5} \%$, | $1 / 2$ | 0 |
| $\operatorname{Sin} A$ | 0 | $\mathbf{9}$ | $\mathbf{a} \%$ | $\%, 0$, | 1 |
| Tan A | 0 | $\%$ | 1 | V 3 | $\circ$ |

## Example:

Without using tables or calculators, evaluate leaving your answers in rational surd form.
a) $£ \frac{9 \mathrm{~S} \quad \mathbf{6 0}^{\circ}+\sin 60^{\circ}}{\operatorname{Tan} 60^{\circ}}$

$$
\begin{aligned}
& =\frac{1, \frac{5}{2}}{/ 3} \\
& =\frac{1+3}{23} \\
& =\frac{(+V 3) / 3}{2 \times 3} \\
& =\frac{3+3}{6}
\end{aligned}
$$

b $\frac{\operatorname{Cos} 60^{\circ} \operatorname{Sin} 60^{\circ}}{\operatorname{Sin} 90^{\circ}--\operatorname{Tan} 30^{\circ}}$
c) $\operatorname{Tan} 60^{\circ}+3 \operatorname{Cos} 45^{\circ}$
d) $\operatorname{Sin}(45) \operatorname{Cos}\left(45^{\circ}\right)$

Note that: $\operatorname{Tan} 60^{\circ}=(\operatorname{Tan} 60)$

## Exercise

2 Finidthe vilues of $a$ and $b$ in these figures.

b

3 Find the values of $p$ and $q$ in these figures.

4 a Write down the values of $\sin 67^{\circ}, \cos 67^{\circ}$ and $\tan 67^{\circ}$.
b Show that (i) $\frac{\sin 67^{\circ}}{\cos 67^{\circ}}=$ f-11 $07^{\circ}$
(ii) $\sin ^{2} 67^{\circ}+\cos ^{2} 67^{\circ}=1$

5 a Find the values of $\sin ^{\circ} 5^{\circ}, \cos 5 \hat{s}^{\circ}, \sin 35^{\circ \prime}$ and $\cos 3 \$^{\prime \prime}$,
b Show that (i) $\sin J^{\prime \prime}=\cos \left(9^{\prime \prime}-\mathbf{S}^{\prime \cdot}\right)$
(ii) $\operatorname{sit} 35^{2}+\cos ^{2} \frac{1}{3} \bar{S}^{\mathrm{n}}=1$
(ut) $\cos 35^{\circ}=\operatorname{sml}\left(9 \mathrm{C}^{\circ}-35^{\circ}\right)$

## Angle of Elevation and Angle of Depression

An observer in a car at some distance sees a bird on top of a tall Building as shown in the diagram below.

Note that the angle at which the observer sees the bird is the Same as the angle at which the bird sees the observer. Hence angle of depression is equal to angle of elevation.

## Example

Eric is standing 5 m trom a tree. He measures the angle of elevation of the top of the tree and finds that it is $26^{\circ}$. Eric is 1.6 m tall. How tall is the tree?

The top of the tree is $(\mathrm{h}-1.6)$ metres taller than Eric.
$\tan 26^{\circ}=\frac{\text { opp }}{\text { adj }}=\frac{h-1.6}{35}$
$h-1.6=35 \tan 26^{\circ}=17.1 \mathrm{~m}$
$h=1.6+17.1=18.7 \mathrm{~m}$
The tree is 18.7 m tall.

## Exam ple

The angle of depression of an object on the groufld from the top of a building is $34^{\circ}$. The torizontal distanee from oibe in of a building is $34^{\circ}$. The herizontal distanie from the oble the ground to the base of the building is 76 metres.- Whatis $\mathrm{s} h$ height of the building?

If the height of the building is $h$ metres,
[an $54^{\text {e }}=\frac{\text { opp }}{\text { hyp }}=\frac{h}{76}$
and $h=76 \tan 34^{\circ}=51.3$ metres.
Example A ship sails 40 km south from a port and then 50 km west. What is its bearing from the port?
$\tan \mathrm{A}=50^{\circ \circ} \mathrm{A}=51.3^{\circ}$
The bearing is $180^{\circ}+\mathrm{A}=231^{\circ}$

## Exercise

1 Find the angles marked with letters.

3. Fkill a, who is 1.7 ml tall, stands 20 ml from a vertical $t_{\text {ce }}$ and finds that the angle of elevation of the top of the tree is 3 . Find the leight of the tree, assuming that the tree is perpendicular to the ground.
4 The angle of elevation of the top of a flagpole is $54^{\circ}$ from a point om the ground 10 mv from the base of pole. Find the leight of the flagpole.
§ From the top of a vertical cliff 65 metres high, the angle of depression of a boat is $28^{\circ}$. Find the distance of the boat from the foot of the cliff.

6 The distance of a boat from a vertical cliff is 1500 metres. The angle of depression of the boat from the top of the cliff is 6 . Find the height of the cliff.
7 A ladder is placed with its foot 6 metres from the bottom of ${ }_{a}$ wall o metres high. If the ladder reaches the top of the wall, find the angle that the ladder makes with the ground.
8 Atree is 12 metres tall, and, from a point level with the base ot the tree, the angle of elevation of the top of the tree is 23 . From another point, in line with the first point and the base of the tree, the angle of elevation of the top of the tree is $18^{\circ}$. How fa apart are the two points? (There are two possible answers.)
9 A ladder rests against a wall in such a wav that it makes an angle of $42^{\circ}$ with the wall and its foot is 7 metres from the wall. Calculate the height reached by the top of the ladder.

Angles greater than $90^{\circ}$
Consider a unit circle,

In i) $0^{\circ}<0<90^{\circ}, \mathrm{P}$ is the first quadrant.

$0 \mathrm{~N}=1 \times \operatorname{Cos} 0=\operatorname{Cos} 8$
$N P=1 x \operatorname{Sin} 0=\operatorname{Sin} 8$.
and hence the coordinates of $\mathrm{P}(\operatorname{Cos} 8, \operatorname{Sin} 8)$. Both the Cosine and the sine are positive. Hence Tangent is also positive.

In ii) $90<0<180^{\circ}$,

8 is in the second quadrant so that $x$-coordinate(a) is negative while the $y$-coordinate (b) is positive. Therefore for obtuse angles, sines (+ve) but cosines and tangents are (-ve)

In iii) $180<0<27 \mathrm{O}$,

8 is in the third quadrant. The $x$ - and $y$-coordinates are negative, therefore sines(-ve)and cosines(-ve) while the tangents (+ve).

In iv) $270^{\circ}<8<360$

8 is in the fourth quadrant. Then xis positive and y negative.
Therefore the cosines (+ve) while the sines and tangents (-ve). In summary, sines, cosines and tangents are all positive in the 1quadrant.Sines are positive in the $2^{\prime \text { d }}$, tangents in the $3^{\prime \prime}$ and cosine in the $4^{\prime \prime}$.

Note

$$
\begin{aligned}
\operatorname{Sin} 150^{\circ} & =\operatorname{Sin}(180-150) \\
& =\operatorname{Sin} 30^{\circ} \\
\operatorname{Cos} 150^{\circ} & =-\operatorname{Cos}(180-150) \\
& =-\operatorname{Cos} 30^{\circ}
\end{aligned}
$$

$\operatorname{Cos} 240^{\circ}=-\operatorname{Cos}\left(240-180^{\circ}\right.$

$$
=-\operatorname{Cos} 60^{\circ}
$$

## Exercise:

Use four figured tables to fined sines, cosines, and tangents of the following angles.
a) $125^{\circ}$
b) $282^{\circ}$
c) $180^{\circ}$
d) $196^{\circ}$
e) $305^{\circ}$
f) $25^{\circ}$
g) $135^{\circ}$
h) $300^{\circ}$
i) $250^{\circ}$

WAVES (TRIGONOMETRIC FUNCTIONS).
Sine functions
Plot the graph of sine in the range $0<0<360^{\circ}$
Solution:
Let $\mathrm{y}=\operatorname{Sin} 0$.

| e | $0^{\circ}$ | $30^{\circ}$ | $60^{\circ}$ | $90^{\circ}$ | $120^{\circ}$ | $150^{\circ}$ | 180 | $210^{\circ}$ | $240^{\circ}$ | $270^{\circ}$ | 300 | 330 | 360 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| sine | 0.00 | 0.05 | 0.87 | 1.00 | 0.87 | 0.50 | 0.00 | - | - | - | - | -0.5 | 0.00 |

Give the values of 0 for which $\sin 0=0.5$ for $0^{\circ}<0<360^{\circ}$
For Cosine function
The plot the graph of $\operatorname{Cos} 6$ for which $0<0<360^{\circ}$
Solution
Let $y=\operatorname{Cos} 8$

| e | $0^{\circ}$ | $30^{\circ}$ | $60^{\circ}$ | $90^{\circ}$ | $120^{\circ}$ | $150^{\circ}$ | $180^{\circ}$ | $210^{\circ}$ | $240^{\circ}$ | $270^{\circ}$ | $300^{\circ}$ | $330^{\circ}$ | $360^{\circ}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\operatorname{Cos} 6$ | 1.00 | 0.87 | 0.5 | 0 | -0.5 | - | - | - | -0.5 | 0 | 0.5 | 0.87 | 1 |

## The Tangent function.

Plot the graph of Tan O for which $0^{\circ}<\mathbf{O}<360^{\circ}$

| 0 | $0^{\circ}$ | $15^{\circ}$ | $30^{\circ}$ | $45^{\circ}$ | $60^{\circ}$ | $75^{\circ}$ | $90^{\circ}$ | $105^{\circ}$ | $120^{\circ}$ | $135^{\circ}$ | $150^{\circ}$ | $165^{\circ}$ | $180^{\circ}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Tan0 | 0 | 0.27 | 0.58 | 1 | 1.73 | 3.73 | oo | - <br> 3.73 | - <br> 1.73 | -1 | - | - |  |

## Exercise:

1) Find from your graph of $y=\operatorname{Tan} 0$ the values of $(y=\tan 0)$ which satisfies the following equations given the range O<0<270
i) $\operatorname{Tan} x=3$
ii) $\operatorname{Tan} x=0.65$
iii) $\operatorname{Tan} x=-2.5$
2) On the same pair of axes, draw the graphs of Tan $O$ and Cos e for $0^{\circ}<0<180^{\circ}$.
State the values of 8 for which $\tan 0=\operatorname{Cos} 8$
3) On the same pair of axes, draw the graphs of $\operatorname{Sin} 0$ and $\operatorname{Cos} 8$ for which $0^{\circ}<0<180^{\circ}$.

The Sin rule.
Both the Sine and the Cosine rules are used to find lengths and angles in any triangle, while the Sine, Cosine and Tangent ratios are only used on right angled triangles.

In a triangle, the small letters are used for the sides while the capital letters are for the angles.

In the figure below, 0 is the center of the circumcircle of a triangle $A B C$ with diameter $B O X$ and $R$ the radius.

Angle $B C X$ is a right angle (angle in a semi-circle)
Angle BAC $=$ BXC (angles in the same segment)
In triangle BXC
$\operatorname{Sin} 0 x={ }_{2 R}^{\prime \prime}=\operatorname{Sin} A$
$\frac{a}{\sin A}=2 R$
When the same procedure is done for Band C , we obtain
$\frac{a}{\sin A}=\frac{b}{\sin B}=\frac{c}{\sin C}=2 R$
...This is the sine rule for the triangle ABC.

## EXERCISE4d

In questions $1--12$ solve $/ \mathrm{ABC}$ from the data, using the sine rule. Give side lengths to $2 S$ and angles to the nearest degree

```
    \(a=12 \cdot 4 \mathrm{~cm}, B=37^{\circ}, C=84^{\circ}\)
    \(a=092 \mathrm{~cm}, B=66^{\circ}, C=42^{\circ}\)
    \(b=48 \mathrm{~km}, C=70^{\circ}, A=69^{\circ}\).
\(4 \quad b=8.3 \mathrm{~cm}, C=22^{\circ}, A=35^{\circ}\).
    \(5 c=1.64 m, A=57^{\circ}, B=49^{\circ}\)
    6. \(A=43^{\circ}, a=4.9 \mathrm{~cm}, b=6-2 \mathrm{~cm}\)
    7/ \(\mathrm{C}=71^{\circ}, a=7.3 \mathrm{~m}, c=8.4 \mathrm{~m}\)
    \(8 B=108^{\circ}, \boldsymbol{b}=5.6 \mathrm{~cm}, \boldsymbol{c}=3.8 \mathrm{~cm}\)
    \(9 \quad B=27^{\circ}, a=6.7 \mathrm{~cm}, b=3.8 \mathrm{~cm}\)
    \(10 \quad A=63^{\circ}, a=7.3 \mathrm{~cm}, c=8.2 \mathrm{~cm}\)
    11- \(B=131^{\circ}, a=10.3 \mathrm{~m}, b=6.9 \mathrm{~m}\)
    \(12 C=58^{\circ}, a=122 \mathrm{~km}, c=10.9 \mathrm{~km}\)
```

## The Cosine rule

## For triangle ABM

$$
\begin{align*}
A B & =A C--A M \\
c^{2} & =(a-n)^{2}+h^{2} \\
& =\mathbf{a}-2 a n+\mathbf{n}+\mathbf{h} \tag{1}
\end{align*}
$$

## For triangle AMC

$M C=A C \cdot A M$
n2 $=\mathbf{b}$ - h2

Combining the equations (1) and (2)

$$
\begin{align*}
\mathbf{C} & =\mathbf{a}-2 a n+(\mathbf{b}-\mathbf{h})+\mathbf{h} \\
& =a^{2}-2 a^{2}+b^{2} \ldots \ldots . . . . . . . . . . . . . . ~ \tag{3}
\end{align*}
$$

Also from triangle AMC
$\mathrm{n}=\mathrm{b} \operatorname{Cos} \mathrm{C}$.
Combining (3) and (4).
$\mathrm{C}=\mathbf{a}-2 \mathrm{a}(\mathrm{b} \cos \mathrm{C})+\mathbf{b}$
$\mathbf{C}=\mathbf{a}+\mathbf{b}-2 \mathrm{ab} \cos C$
N.B The same can be done for band $B$, and $a$ and $A$.
i.e. $\mathbf{a}=\mathbf{b}+\mathbf{c}-2 \mathrm{ac} \operatorname{Cos} A$

$$
b^{2}=a^{2}+c^{2}-2 a c \operatorname{Cos} B
$$

$\therefore$ This is the Cosine rule of a triangle ABC

## EXERCISE 4 e

In questions $1-5$. solve the triangles by using the cosine rule once and then the sine rule.

$$
\begin{array}{ll}
1 & B=67, a=7 \cdot 1 \mathrm{~cm}, c=5.2 \mathrm{~cm} \\
2 & \mathrm{~A}=58^{\circ}, b=14 \mathrm{~cm}, c=23 \mathrm{~cm} \\
3 & C=132^{\circ}, a=150 \mathrm{~m}, b=120 \mathrm{~m} \\
4 & \mathrm{~A}=47, \mathrm{~b}=1 \cdot 42 \mathrm{~km}, \mathrm{c}=2.51 \mathrm{~km} \\
5 & B=118^{\circ}, c=82 \mathrm{~cm}, a=167 \mathrm{~cm}
\end{array}
$$

*Stay Home, Stay safe.*
