

Qn	Answer	Marks
1. (a)	(i) ...the ratio of the charge of the ion to the mass of the ion. ✓	1
	(ii) ...different forms of the same element having the same atomic number but different mass numbers ✓	1
	(iii) ...a twelfth of the mass of the carbon atom $^{12}_6\text{C}$ ✓	1
(b)	<p>(i)</p> 	1
	<p>(ii) Let <math>Q</math> = charge on the ion  <math>v</math> = velocity of the ion  <math>E</math> = electric field intensity between                  Then for ions that pass straight through <math>S_2</math>                  Magnetic force on the ion = electric force on the ion ✓                  i.e. <math>BQv = EQ</math> ✓  <math display="block">v = \frac{E}{B} = \frac{400}{0.5} = 800 \text{ m s}^{-1}</math> ✓</p>	1 1 1
	<p>(iii) Beyond <math>S_2</math> describe a circular path of radius, say <math>r</math>, striking a horizontal photographic plate through <math>Y</math>, at a distance <math>2r</math> from <math>S_2</math>.                  Let <math>M</math> = mass of the ion                  Then <math>BQv = \frac{Mv^2}{r}</math> ✓  <math>\therefore r = \frac{Mv}{BQ}</math> ✓                  Now, since all the ions carry the same charge and have the same velocity, difference in <math>r</math> will reveal different mass numbers. ✓                  So isotopes can be identified.</p>	1 1 1

(c)	(i) The mass of a nucleus is less than the total mass of the nucleons when they are separate. The difference is called the mass defect. ✓	1						
	(ii)  Binding energy per nucleon vs Mass number. ✓	1						
	(iii) The graph has a peak. The elements with mass number smaller than that for the peak will release energy if they underwent fusion because the resulting nucleus is of higher binding energy per nucleon. ✓ On the other hand elements with mass number greater than that for the peak will release energy if they underwent fission because the resulting nuclei then are of higher binding energy per nucleon. ✓	1½ 1½						
(d)	<table border="1" data-bbox="247 1064 1289 1288"> <thead> <tr> <th data-bbox="247 1064 726 1108">RADIOACTIVITY</th> <th data-bbox="726 1064 1289 1108">NUCLEAR FISSION</th> </tr> </thead> <tbody> <tr> <td data-bbox="247 1108 726 1209">- Occurs spontaneously</td> <td data-bbox="726 1108 1289 1209">-Not spontaneous. It is effected by bombardment of the nucleus with a neutron ✓</td> </tr> <tr> <td data-bbox="247 1209 726 1288">- One of the resulting nucleus is of dominant mass</td> <td data-bbox="726 1209 1289 1288">-There are nuclei of comparable masses among the products ✓</td> </tr> </tbody> </table> <p data-bbox="247 1332 1289 1545">(ii) <math>{}_{88}^{226}\text{Ra} \rightarrow {}_{86}^{222}\text{Rn} + {}_2^4\text{He}</math>            Energy released = Mass of Ra - (mass of Rn + mass He) ✓            = 226.0254 - (222.0175 + 4.0026) ✓            = 0.0053 u ✓            = 0.0053 x 931 = <b>4.9343 MeV</b> ✓</p>	RADIOACTIVITY	NUCLEAR FISSION	- Occurs spontaneously	-Not spontaneous. It is effected by bombardment of the nucleus with a neutron ✓	- One of the resulting nucleus is of dominant mass	-There are nuclei of comparable masses among the products ✓	1 1 1 1
RADIOACTIVITY	NUCLEAR FISSION							
- Occurs spontaneously	-Not spontaneous. It is effected by bombardment of the nucleus with a neutron ✓							
- One of the resulting nucleus is of dominant mass	-There are nuclei of comparable masses among the products ✓							
<b>Total = 20</b>								
2. (a)	<p data-bbox="247 1624 1289 1691">(i) If no external force acts on a system of colliding bodies, the total momentum of the bodies remains constant. ✓</p> <p data-bbox="247 1736 1289 1960">(ii) Suppose a particle of mass <math>m_1</math> originally moving with velocity <math>u_1</math> collides with another particle of mass <math>m_2</math> which is originally moving with velocity <math>u_2</math>. Then <math>m_1</math> exerts a force <math>F_1</math> on <math>m_2</math> to change the velocity of <math>m_2</math> from <math>u_2</math> to <math>v_2</math> (according to the first law). Also <math>m_2</math> exerts a force <math>F_2</math> on <math>m_1</math> to change the velocity of <math>m_1</math> from <math>u_1</math> to <math>v_1</math>. ✓            Suppose the collision lasts for time <math>\delta t</math>. Then, according to the second law</p> <p data-bbox="367 1960 1037 2027"><math>F_1 = k \frac{m_2(v_2 - u_2)}{\delta t}</math>, where <math>k</math> is a constant ✓</p>	1 ✓						

	<p>and <math>F_2 = k \frac{m_1(v_1 - u_1)}{\delta t}</math> ✓</p> <p>According to the third law, <math>F_2 = -F_1</math> ✓</p> <p><math>\therefore k \frac{m_1(v_1 - u_1)}{\delta t} = -k \frac{m_2(v_2 - u_2)}{\delta t}</math> ✓</p> <p><math>\therefore m_1v_1 - m_1u_1 = -m_2v_2 + m_2u_2</math></p> <p><math>\therefore \mathbf{m_1u_1 + m_2u_2 = m_1v_1 + m_2v_2}</math> ✓</p> <p><math>\therefore</math> <b>Total momentum before collision = Total momentum after collision</b></p>	
<p>(b)</p>	<p>Let <math>v</math> = velocity of the water as it leaves the nozzle  <math>A</math> = cross-sectional area of the nozzle                  Then the mass issuing per second = <math>Av\rho</math>                  Now, the force exerted on the spring = rate of change of momentum ✓</p> <p><math>\therefore Av\rho.v = kx</math>, where <math>x</math> = compression of the spring</p> <p><math>\therefore v^2 = \frac{kx}{A\rho}</math> ✓</p> <p><math>\therefore v \sqrt{\frac{kx}{A\rho}} = \sqrt{\frac{512 \times 0.05}{4 \times 10^{-4} \times 1000}}</math> ✓</p> <p><math>= 8 \text{ m s}^{-1}</math> ✓</p>	<p>1</p> <p>1</p> <p>1</p> <p>1</p>
<p>(c)</p>	 <p>When the fuel in the combustion chamber is burnt, the molecules of the products gain tremendous kinetic energy and collide with the walls of the combustion chamber. ✓</p> <p>Due to the high rate of change of momentum, a force is created on the chamber's walls. ✓</p> <p>Now, because of the opening in the rear, there is a net force in the forward direction of the rocket. So the rocket is pushed forward. ✓</p>	<p>1</p> <p>1</p> <p>1</p>
<p>(d)</p>	 <p>(i) <math>T - 0.3g = 1a</math> ..... (1) ✓</p> <p><math>2g \sin 30^\circ - T - (2 \times 0.3g \cos 30^\circ) = 2a</math></p> <p><math>\therefore g - T - 0.3g\sqrt{3} = 2a</math> ..... (2) ✓</p> <p>Eq(1) + Eq(2): <math>g - 0.3g - 0.3g\sqrt{3} = 3a</math> ✓</p>	<p>1</p> <p>1</p> <p>1</p> <p>1</p>

$\therefore a = \frac{0.18g}{3} = 0.589 \text{ m s}^{-1}$ ✓	1
(ii) From (1): $T = a + 0.3g$ ✓ $= 0.589 + 2.943$ $= 3.53 \text{ N}$ ✓	1 1
<b>Total = 20</b>
