

Qn	Answer	Marks
1 (a)	(i)... two equal but unlike parallel forces whose lines of action are not the same. ✓	1
	(ii) The moment of a force about a given point is the product of the force and the perpendicular distance from the point to the line of action of the force. ✓	1
(b)	 <p>Let the lines of action of the forces, F, be separated by a distance s. Suppose AB rotates through an angle θ, in radians, to position A'B'. The displacement of each of the forces, F, is $\frac{1}{2} s\theta$ ✓ The total work done by the two forces is $W = F.s\theta$ ✓ i.e. $W = T.\theta$ ✓ where T is the torque. ✓ \therefore Work done by a couple = torque x angle of rotation ✓</p>	1 1 1 1
(c)	 <p>Let F be the additional force at an angle θ to the 4N force Then $F \sin\theta + 6 \sin 30^\circ - 12 \cos 30^\circ = 0$ ✓ $\therefore F \sin\theta = 12 \cos 30^\circ - 6 \sin 30^\circ$ ✓ $= 6\sqrt{3} - 3 = 7.39 \text{ N}$ ✓ and $F \cos\theta + 4 - 6 \cos 30^\circ - 12 \cos 60^\circ = 0$ ✓ $\therefore F \cos\theta = 6 \cos 30^\circ + 12 \cos 60^\circ - 4$ ✓ $= 3\sqrt{3} + 6 - 4 = 7.20 \text{ N}$ ✓ $\therefore F = \sqrt{7.39^2 + 7.20^2} = \sqrt{54.61 + 51.84}$ ✓ $= 10.32 \text{ N}$ ✓ Now $\tan \theta = \frac{F \sin\theta}{F \cos\theta} = \frac{7.39}{7.20} = 45.7^\circ$ ✓</p>	1 1 1 1 1

<p>(c)</p>	<p>(i)</p>  <p>Taking moments about the hinge, B</p> $T \times 5 \sin 25^\circ = 100 \times 2.5 \sin 60^\circ + 200 \times 3 \sin 60^\circ \dots (1)$ $\therefore T = \frac{216.5 + 519.6}{2.11} = 348.9 \text{ N}$	<p>1</p> <p>1</p> <p>1</p>
	<p>(ii) $B_x = T \sin 35^\circ = 348.9 \sin 35^\circ = 200 \text{ N}$ and $B_y + T \cos 35^\circ = 200 + 100$ $\therefore B_y = 300 - 348.9 \cos 35^\circ = 14.2 \text{ N}$ \therefore Reaction at B = $\sqrt{200^2 + 14.2^2}$ $= 200.5 \text{ N}$ at an angle $\theta = \tan^{-1} \left(\frac{200}{14.2} \right)$ to the vertical = 85.9°</p>	<p>1½</p> <p>1</p> <p>½</p> <p>1</p> <p>1</p>
<p>Total = 20</p>		
<p>2 (a)</p>	 <p>(i) Unbanked On an unbanked track the only forces constituting the centripetal force are the frictional forces F_1 and F_2 at the tyres. If v_1 is the velocity when the car is on the point of sliding sideways, then</p> $\frac{mv_1^2}{r} = F_1 + F_2 = \mu(R_1 + R_2) \dots (1)$ <p>(ii) Banked</p>	<p>1</p> <p>1</p> <p>½</p>

	<p>When the track is banked, the horizontal components of the normal forces R_1 and R_2 also contribute to the centripetal force. ✓</p> <p>If v_2 is the velocity when the car is on the point of sliding outwards, then</p> $\frac{mv_2^2}{r} = (F_1 + F_2) \cos \theta + \mu(R_1 + R_2) \sin \theta$ $= \mu(R_1 + R_2) \cos \theta + (R_1 + R_2) \sin \theta$ $= (R_1 + R_2)(\mu \cos \theta + \sin \theta) \dots\dots\dots (2) \quad \checkmark \times$ <p>From (1) and (2) it is clear that $v_2 > v_1$</p>	<p>1</p> <p>1/2</p>
<p>(b)</p>	 <p>(i) It will break when the stone is in the lowest position because the tension at that point will be $T = mg + m\omega^2 r$, where r is the length of the string and ω the angular speed ✓✓</p> <p>(ii)</p> $mg + m\omega^2 r = 20 \quad \checkmark$ $g + r\omega^2 = \frac{20}{m}$ $\therefore 9.81 + 0.5\omega^2 = \frac{20}{0.5} = 40 \quad \checkmark \times$ $\therefore \omega^2 = \frac{40 - 9.81}{0.5} = 60.4 \quad \checkmark \times$ $\therefore \omega = \sqrt{60.4} = 7.77 \text{ radians} \quad \checkmark$	<p>1</p> <p>1</p> <p>1</p> <p>1/2</p> <p>1/2</p> <p>1</p>
	<p>(iii) The stone sets off with a speed $v = r\omega = 0.5 \times 7.77$ ✓×</p> <p>Let t be the time to hit the ground.</p> <p>Then, using $s = ut + \frac{1}{2}at^2$</p> $0.5 = 0 + \frac{1}{2} \times 9.81t^2 \quad \checkmark \times$ $\therefore t = \sqrt{\frac{0.5}{4.905}} = 0.319 \text{ s} \quad \checkmark \times$ <p>The stone lands at a distance $x = vt$ away</p> $= 0.5 \times 7.77 \times 0.319 \quad \checkmark \times$ $= 1.24 \text{ m} \quad \checkmark$	<p>1/2</p> <p>1/2</p> <p>1/2</p> <p>1/2</p> <p>1</p>
<p>(c)</p>		

	<p>The weight, mg, of the rider and his bicycle, is concentrated at the centre of gravity, G. ✓</p> <p>For him to describe a circle, a force, F, must act on him towards the centre of the circle and this is provided by the frictional force at the road surface. ✓</p> <p>Now, a horizontal centrifugal force, F' equal to F, acts on him through G. ✓</p> <p>This produces a moment that would topple the rider outwards. ✓</p> <p>So he leans inwards so as that his weight provides an equal counterbalancing moment. ✓</p> <p>i.e $Fh = mgx$ ✓</p>	<p>½</p> <p>½</p> <p>½</p> <p>½</p> <p>½</p> <p>½</p>
(d)	<p>(i) ...an orbit round a planet in which a satellite always remains positioned vertically above the same point on the planet's surface. ✓</p>	<p>1</p>
	<p>(ii) Let m = mass of the satellite and ω = angular velocity in the orbit T = period</p> <p>Then $m(r + h)\omega^2 = \frac{GMm}{(r + h)^2}$ ✓</p> <p>$\therefore m(r + h)\frac{4\pi^2}{T^2} = \frac{GMm}{(r + h)^2}$</p> <p>But from equation at the earth's surface, $GM = gr^2$ ✓</p> <p>Substituting for GM, we have</p> $\frac{4\pi^2}{T^2} = \frac{gr^2}{(r + h)^3}$ ✓ <p>$\therefore T = \sqrt{\frac{4\pi^2(r + h)^3}{gr^2}}$ ✓</p>	<p>1</p> <p>½</p> <p>½</p> <p>1</p>
	<p>(iii) Now $(r + h)^3 = \frac{gr^2T^2}{4\pi^2}$</p> <p>$\therefore h = \sqrt[3]{\frac{gr^2T^2}{4\pi^2}} - r$ ✓</p> $= \sqrt[3]{\frac{9.81 \times (6.4 \times 10^6)^2 \times (24 \times 3.6 \times 10^3)^2}{4\pi^2}} - 6.4 \times 10^6$ ✓ $= 42.35 \times 10^6 - 6.4 \times 10^6$ $= \mathbf{3.6 \times 10^6 \text{ m}}$ ✓	<p>½</p> <p>½</p> <p>1</p>
<p>Total = 20</p>
