| SECTIONA: MECHANICS |
| CHAPTER1: DIMENSIONS OF A PHYSICAL QUANTITY |
| 1.1.0: Fundamental quantities |

EcoleBooks

These are quantities which can't be expressed in terms of any other quantities by using any mathematical equation. E.g.

| Mass - M | Length - L | Time- T |
|----------|------------|---------|
| | | |

1.1.1: Derived quantities

These are quantities which can be expressed in terms of the fundamental quantities of mass, length, and time e.g.

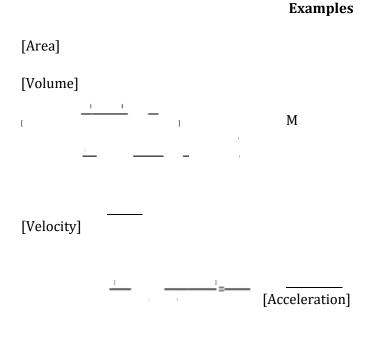

| i) Pressure | iii) Momentum |
|------------------|---------------|
| ii) Acceleration | iv) Density |

1.1.2: DIMENSIONS OF A PHYSICAL QUANTITY

This refers to the way a derived quantity is related to the three fundamental quantities of length, mass and time.

Or It refers to the power to which fundamental quantities are raised.

Symbol of dimensions is []

[Momentum] [Mass][Velocity] M [Weight] [Mass][Gravitational acceleration] M [Force] [Mass][Acceleration] M

[Pressure] M

NB. Dimension less quantity has no dimensions and is described by a number which is independent of a unit of measurement chosen for the primary quantities

EcoleBooks

Examples of dimension less quantities

- Refractive index
- strain
- They are always given a dimension of one, (1)

1.1.3: USES OF DIMENSIONS

Used to check the validity of the equation or check whether the equation is dimensionally consistent or correct.

Used to derive equations

Checking validity of equations (dimensional homogenity)

When the dimensions on the L-H-S of the equations are equal to the dimensions on the R-H-S, then the equation is said to be dimensionally consistent.

Examples

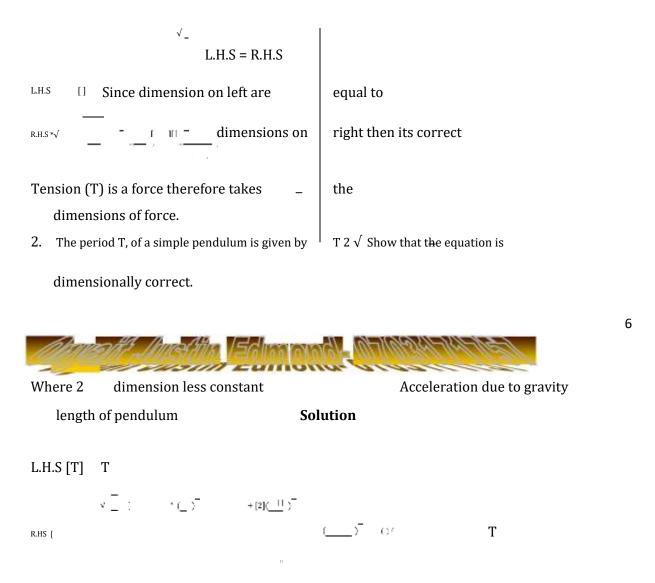

- 1. The velocity V of a wave along a flat string is given by $\sqrt{-}$
 - T Tension in the string
 - L Length of the string
 - M Mass of the string

Show that the formula is dimensionally correct. (----)=()

Solution

- relative density
- * all constants such as 2π , 2, π , 4π , .

-

Since the dimensions on the L.H.S are equal to the dimensions on the R.H.S then the equation is dimensionally consistent.

NB: Dimensions cannot be added or subtracted but for any equation to be added or subtracted then they must have the same dimensions.

Example

Show that the equation = is dimensionally correct.

Solution

] ()

Ecolebooks.com

EcoleBooks

7

L.H.S [[] R.H.S [[2as]

Since dimensions on the L.H.S are equal to dimensions on the R.H.S then the equation is dimensionally correct.

Exercise

Show that the following equations are dimensionally consistent. $(i)) \\ (ii)$

L

b) Deriving equations (dimensional analysis)

The method of dimension analysis is used to obtain an equation which is relating to relevant variables

Example 1

| Amente Anethe Edmond - 0500944 | -MEMEN |
|--|--------------------|
| Assume that the period (T) depend on the following | Т |
| Mass (m) of the bob | Dimensions of M |
| Length (l) of the pendulum | T = K x |
| Acceleration due to gravity (g) | 1 |
| Derive the relation between T, m, l, g | Where K |
| | is a |
| Solution | constant |
| | Dimensi |
| | ons of L |
| | If it's |
| | dimensio |

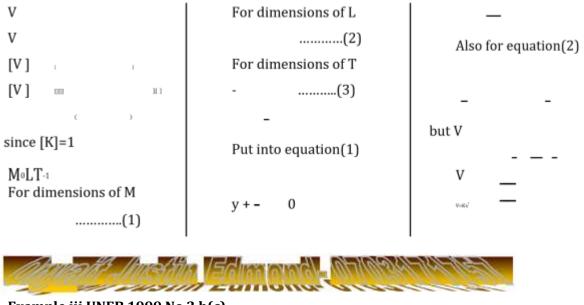

| nally2 | |
|--|-----------------------|
| consistent then Dimensions of T | y = |
| T = x = 1 (1) $T = z = 1$ | x 0, y , z |
| Put into equation2 | Since T = K |
| y + =0 | $T = K_{-}$ |
| Note: | T |

Dimensional analysis does not give the value of a constant K. it can be determined using mathematical analysis.

Example ii

Use dimensional analysis to show how the velocity of transverse vibrations of a stretched string depends on its length (l) mass (m) and the tension force (F) in the string.

solution

8

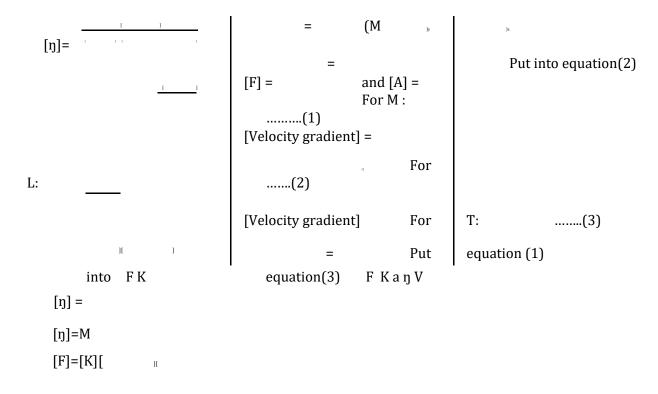

Example iii UNEB 1999 No 2 b(c)

The viscous force (F) on a small sphere of radius (a) falling through a liquid of coefficient of viscosity ŋ with a velocity V given by F=K

Ecoletooks

Use the method of dimensions to find the values of x, y, z (5marks)

Solution

Example iv UNEB 2005 No1 b

The equation for the volume V of a liquid flowing through a pipe in time t under a steady flow is

UNEB 2010 N0 4 (d)

| The velocity V of a wave in a material of young modulus E and density ρ is given by V= $\sqrt{\zeta}$ | |
|--|------------|
| Shows that the relationship is dimensionally correct | (03 marks) |

UNEB2009 No 3b

A cylindrical vessel of cross sectional area, A contains air of volume V, at pressure p trapped by frictionless air tight piston of mass, M. The piston is pushed down and released.

i) If the piston oscillates with simple harmonic motion, shows that its frequency f is given (06 marks)

Show that the expression for f in b(i) is dimensionally correct (03 marks)

UNEB2003 No 1(a)

Distinguish between fundamental and derived physical quantities. Give two examples of each

(04marks)

9

UNEB2002 No1

a) i)What is meant by the dimension of a physical quantity (01mark)

ii)For a stream line flow of a non-viscous, in compressible fluid, the pressure P at a point is related to the width h and the velocity v by the equation.

(P -a) = $\rho g(h-b) + \frac{1}{2} \rho (v_2-d)$ where a, b and d are constant and ρ is the density of the fluid and g

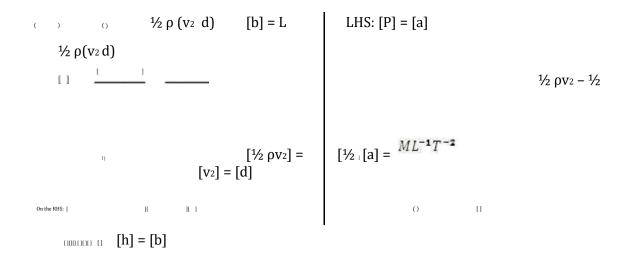

is the acceleration due to gravity. Given that the equation is dimensionally consistent, find

the dimensions of a, b and d (03 marks)

Solution

NB: We only add and subtract quantities which have the same dimensions.

Ecoletooks

UNEB 2001 No 2 b

The velocity V of sound travelling along a rod made of a material of young's modulus y and density ρ is given by $V=\sqrt{2}$ Show that the formula is dimensionally consistent (03 mks)

UNEB 1997 No 1

- a) i) What is meant by dimensions of a physical quantity (1mk)
 - ii)The centripetal force required to keep a body of mass moving it a circular path of radius

is given by _____ show that the formula is dimensionally consistent. (04 marks)

10

CHAPTER2: MOTION

2.1.0: LINEAR MOTION

This is motion is a straight line

Distance

This is the length between 2 fixed point

Displacement

This is the distance covered in a specific direction

Speed

This is the rate of change of distance with time

OR It is the distance covered by an object per unit time.

The SI unit of speed is ms-1

Velocity

It is the rate of change of displacement with time

OR It is the distance covered per unit time in a specific direction

The SI unit of velocity is ms-1

Uniform velocity

Is the velocity of a body which covers equal displacement in equal time intervals.

Acceleration

It is the rate of change of velocity with time

Ecolebooks.com

It SI unit is ms-2

Acceleration = _____

2.1.1:UNIFORM ACCELERATION & EQUATIONS

Uniform acceleration

Its a motion in which the velocity of a body changes by equal magnitudes in equal time intervals

no matter how small the intervals are.

OR Constant rate of change of velocity.

11 Equations of motion

1st equation

Suppose a body moving in a straight line with uniform acceleration a, increases its velocity from u to v in a time t, then from definition of acceleration

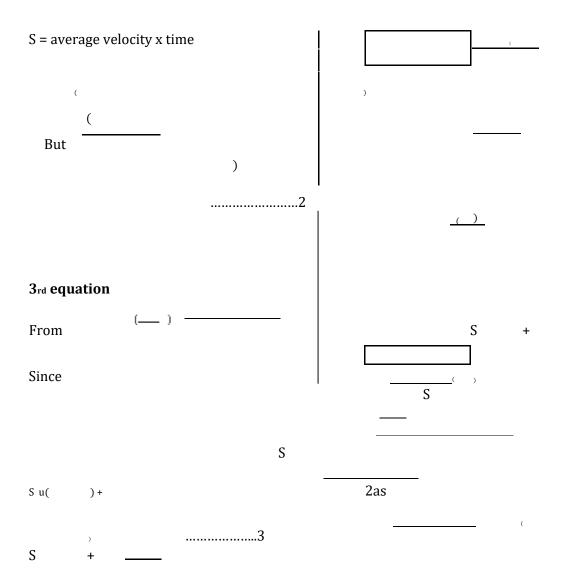

Acceleration =

_____1

$2_{\text{nd}} \ equation$

Suppose an object with velocity u moves with uniform acceleration for a time t and attains a velocity v, the distance s travelled by the object is given by

Note

The three equations apply only to uniformly accelerated motion

When the object starts from rest then (u=0m/s) and when it comes to rest (v=0m/s)

The acceleration can be positive or negative. When its negative, then it known as a retardation or deceleration

Numerical examples

12 A car moving with a velocity of 10ms-1 accelerates uniformly at 1ms-2 until it reaches a velocity of 15ms-1. Calculate,

Time taken

Distance traveled during the acceleration

The velocity reached 100m from the place where acceleration began.

Solution

```
s ii) iii) , v=? u=10ms-1a=1 u=10m/s, a=1m/s, v=15ms-1, s
```

A particle moving in a straight line with a constant acceleration of $2ms_{2}$ is initially at rest; find the distance covered by the particle in the 3_{rd} second of its motion.

Solution

| Using S | Distance in 3rd | |
|--|------------------------|-----------------------------------|
| u=0m/s, t=2s ar | nd t=3s a= $2ms_2 t=2$ | Distance for 3s – distance for 2s |
| : ¹ / ₂ 2 ₂ | | |
| When t=3: a=2n | ns-2 u=0m/s | Distance in 3rds in 5m |
| | 32 | |

A Travelling car A at a constant velocity of 25m/s overtake a stationery car B. 2s later car B sets off in pursuit , accelerating at a uniform rate of 6ms-2. How far does B travel before catching up with A

| Solution | If D is to so the up with A | |
|---|---|---|
| For A: S _A | If B is to catch up with A then it must travel faster i.e | t=12s or t= |
| Since it moves with a constant velocity a 0 | it will take a time of $(t-2)s$ | Since the car leaves 2s later |
| $S_A = 25t$ (1) | $S_{B} = 0x(t-2) + \frac{1}{2}x6(t-2)_{2}$ $S_{B} = 3t_{2}-12t+12(2)$ | then time 12s is correct since it gives a |
| | For B to catch A then | positive value $S_B = 25x12$ |
| For B: S _B _ | Sa=Sb | S _B = 300m |
| | 25t 3t ₂ | |
| | 3t ₂ | 13 |

A train travelling at 72kmh-1under goes uniform deceleration of 2ms-2, when brakes are applied. Find the time taken to come to rest and the distance travelled from the place where brakes are applied.

Solution

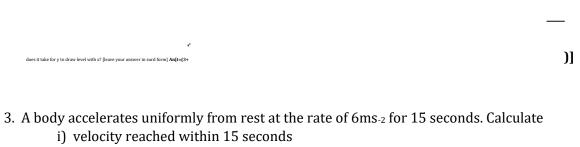

EXERCISE1

A car moving with a velocity of 54km/hr accelerates uniformly at a rate of 2ms-2. Calculate the distance travelled from the place where acceleration began, given that final velocity

reached is 72km/hr and find the time taken to cover this distance. An [, 2.5s]

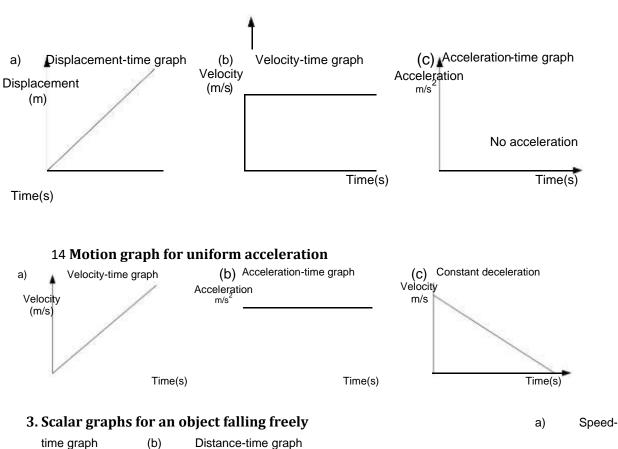

A particle x travels with a constant velocity of 6m/s along straight line. It passes a particle y which is stationery. One second later y accelerates at 2m/s. how long after being passed

Ecolebooks

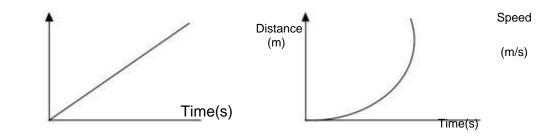

ii) the distance covered within 15 seconds An[90m/s, 675m]

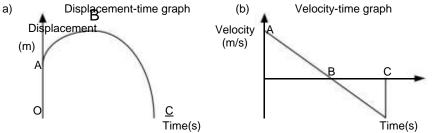

A particle moving on a straight line with constant acceleration has a velocity of 5ms₋₁ at one instant and 4s later it has a velocity of 15ms₋₁. Find the acceleration and distance covered by

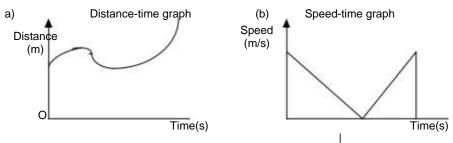

1. Motion graphs for uniform velocity

4. Motion graph for an object thrown vertically upwards from the top of a cliff

5. Scalar graph for an object thrown upwards from a cliff

Note

For a body thrown vertically downwards, For a

becomes becomes

body projected vertically upwards

ecomes ___ ecomes

2.1.2: MOTION UNDER GRAVITY

1. Vertical motion

a) When a body is projected vertically upwards its acceleration (a) is given a g 9.81ms-2

9.81ms-2 means the velocity of a body decreases by a 9.81ms-1 after every second till the time when the velocity is zero (maximum height) and the body falls down again with a positive direction due to gravity.

 $\ddot{A} \ \bar{A} \$

Definition

Acceleration due to gravity is rate of change of velocity with time for an object falling freely under gravity.

OR The force of attraction due to gravity exerted on a 1kg mass.

Numerical examples

A ball is thrown vertically upwards with an initial speed of 20ms-1. Calculate.

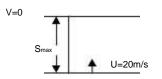

Time taken to return to the thrower

Time taken to reach

Maximum height reached

maximum height

solution u=20ms-1 81ms-2 s projected upwards

From

At max height

But the total time ta ken to return to the

thrower = 2t

at max height v=0m/s, u=20m/s,

1ms-2 A particle is projected vertically upwards with velocity of 19.6ms-1. Find

The greatest height attained

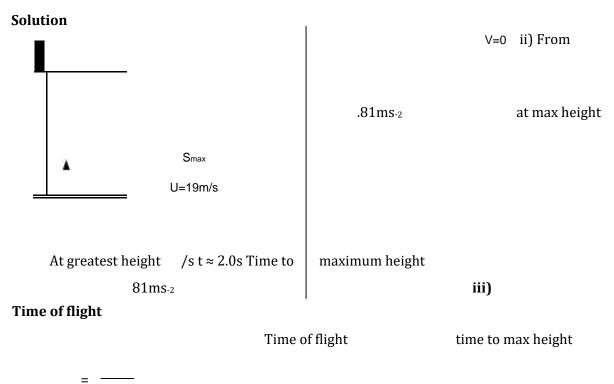

Time taken by the particle to reach maximum height

Ecolebooks.com

EcoleBooks

Time of flight

=19.58m

A man stands on the edge of a cliff and throws a stone vertically upwards at 15ms-1. After what time will the stone hit the ground 20m below the point of projection

Solution V=0 Smax 20m Time to maximum height =

 $1.53s 0 = 15_2 2x9.81$

=11.47m Maximum height = 11.47m

u=15m/s, g=-9.81m/s v=0m/s at max height, =? t=? **Method I** Total height = (11.47+20) =31.47m When the ball begins to return down from max height u=0m/s and a=g=+9.81m/s s=-2m g=-9.81m/s₂ u=15m/s

 $-\frac{1}{2}$ x9.81t₂ 4.905t₂

Time taken to hits the ground = 4.06s

¹∕₂ x9.81t₂

√_____

Total time ()

Time taken to hit the ground

Method II

The height of the cliff = 20m which is below the point of project therefore

Ecolebooks.com

Ecoletooks

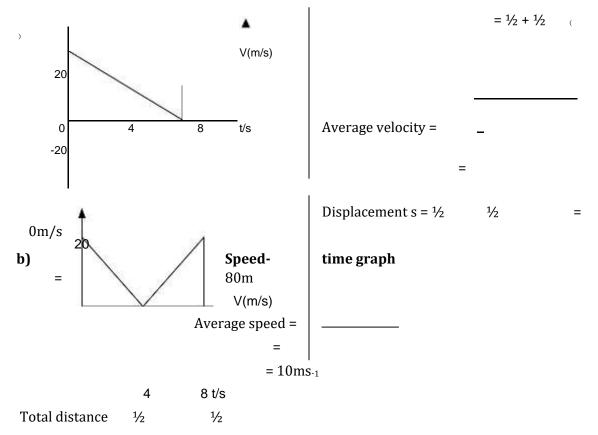

A car decelerates uniformly from 20ms-1 to rest in 4s, then reverses with uniform acceleration back to it original starting point also in 4s

Sketch the velocity-time graph for the motion, and use it to determine the displacement and average velocity

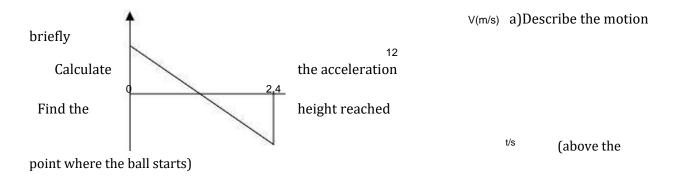

Sketch the speed-time graph for the motion and use it to determine the total distance covered and the average speed.

Solution

5.The graph below shows a ball which is thrown up into the air and then caught

-12

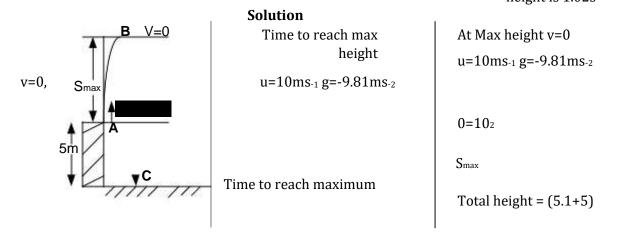

Solution

The ball decelerates uniformly from 12ms₋₁ to rest in 1.2s and then it reverses with uniform acceleration back to its original position in another 1.2s

b) v=-12ms-1 u=12ms-1 t=2.4s
$$-2S = 0m$$

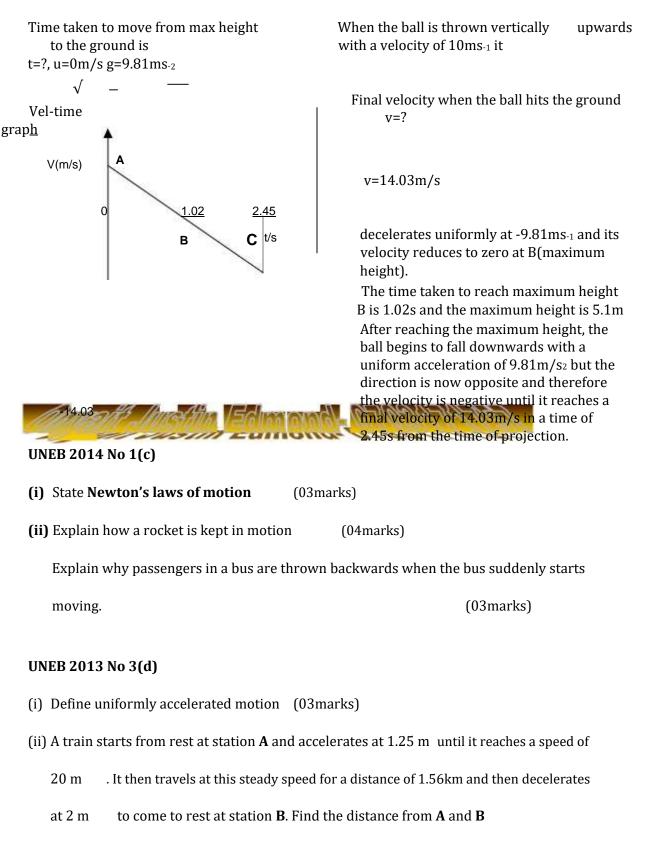

UNEB 2003 No 1 b(ii)

A ball is thrown vertically upwards with a velocity of 10ms-1 from a point 50m above the ground. Describe with the aid of a velocity - time graph, the subsequent motion of the ball. (10marks) height is 1.02s

Ecolebooks.com

i) A stone thrown vertically upwards from the top of a building with an initial velocity of 10m/s. the stone takes 2.5s to land on the ground.
ii) Calculate the height of the building

(iii)State the energy changes that occurred during the motion of the stone (03 marks)

EXERCISE2

- 1. A ball is dropped from a cliff top and takes 3s to reach the beach below. Calculate
- a) The height of the cliff **An(44.1m)**
- b) Velocity acquired by the ball An(29.4m/s)
- 2. With what velocity must a ball be thrown upwards to reach a height of 15m An(17.1ms-1)

A body is thrown upwards with an initial velocity at 2m/s. Calculate;

The maximum height attained

Time taken to reach the maximum height.

An object is dropped from a helicopter. If the object hits the ground after *2s*. Calculate the height from which the object was dropped.

A body is thrown upwards with an initial velocity of *12m/s*.

Calculate the maximum height it attained.

Time taken by the body to return to the ground **2. PROJECTILE MOTION**

This is the motion of a body which after being given an initial velocity moves under the influence of gravity.

Consider a ball projected at 0 with an initial velocity um/s at an angle θ to the horizontal.

Y-axis

θ

X-axis

Resolution of velocity

Ux

Y-axis =

Also: X-axis

Equation (1) is the initial vertical component of velocity

Equation (2) is the initial horizontal component of velocity

Note

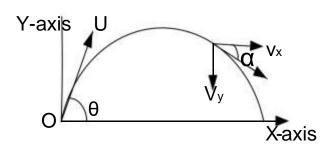

The horizontal component of velocity [=] is constant through the motion and therefore

the acceleration is zero.

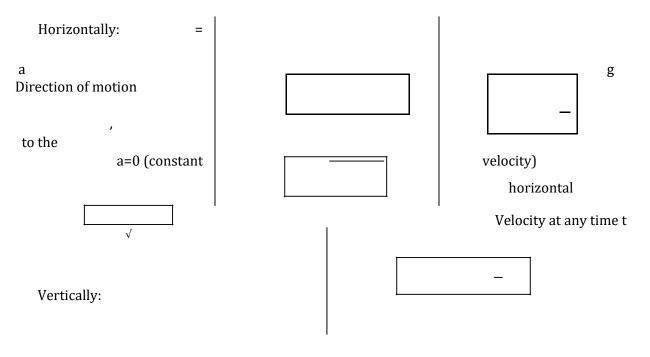

MATHEMATICAL FORMULAR IN PROJECTILES

All formulas in projectiles are derived from equations of linear motion

Finding velocity at any time t.

Finding distances at any time t

horizontally : $+\frac{1}{2}$ at₂

, a= 0

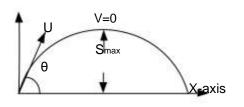

Vertically: $+ \frac{1}{2} at_2$

TERMS USED IN PROJECTILES

1. MAXIMUM HEIGHT [GREATEST HEIGHT] []

For vertical motion : at max height v=0,

, S

,

Y-axis

=

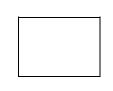

(

Note: () but

2. TIME TO REACH MAX HEIGHT [t]

Vertically at max height v=0

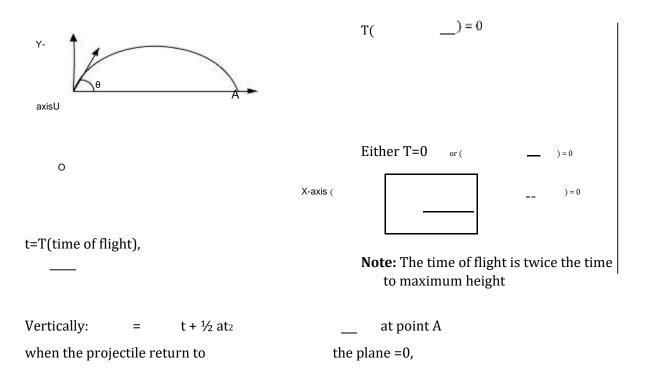

23

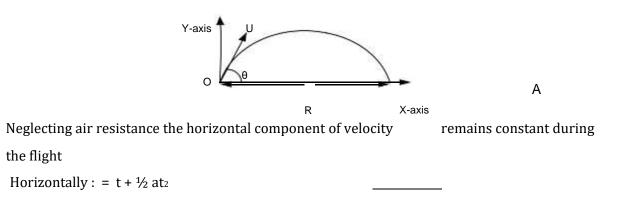

3. TIME OF FLIGHT [T]

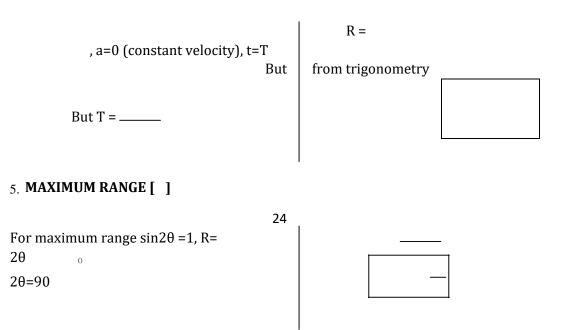

It refers to the total time taken by the projectile to move from the point of projection to the point where it lands on the horizontal plane through the point of projection.

4. **RANGE [R]**

It refers to the horizontal distance from the point of projection to where the projectile lands along the horizontal plane through the point of projection.

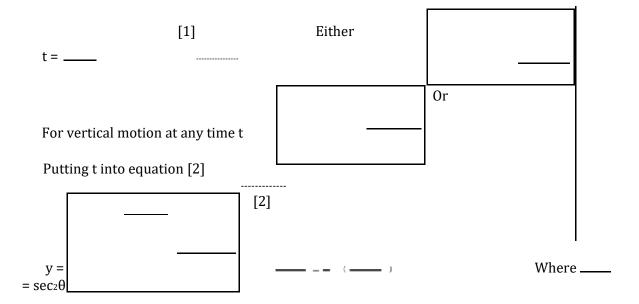

6. EQUATION OF A TRAJECTORY

A trajectory is a path described by a projectile.

A trajectory is expressed in terms of horizontal distance x and vertical distance y. For horizontal motion at any time t

Hint

Ecolebooks

If a particle is projected directly (vertically) upwards the motion it describes is purely kinematics (motion under gravity). But if it is projected at an angle to the horizontal, the motion is parabolic (projectile motion).

Numerical examples

A. Objects projected upwards from the ground at an angle to the horizontal

A Particle is projected with a velocity of 30ms-1 at an angle of elevation of 300. Find

The greatest height reached

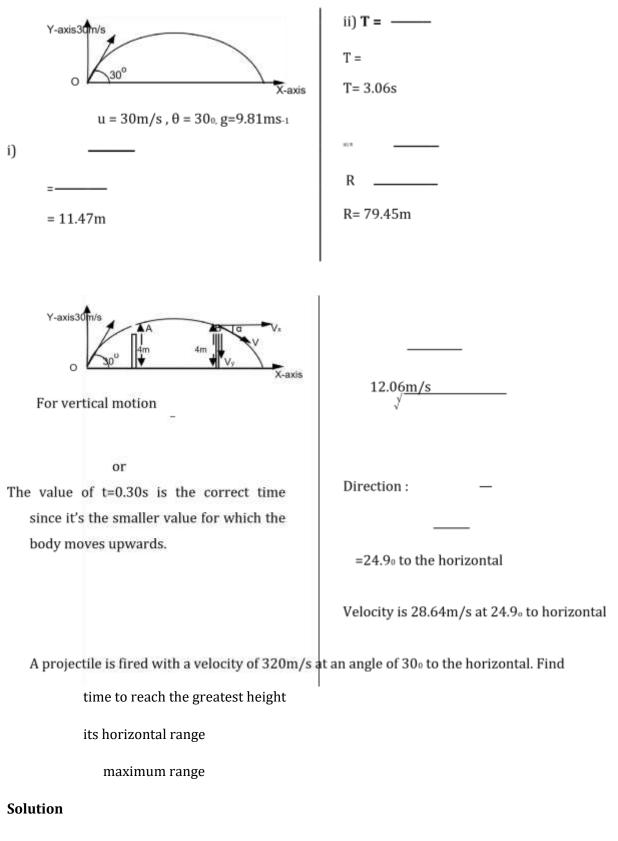

The time of flight

The velocity and direction of motion at a height of 4m on its way downwards

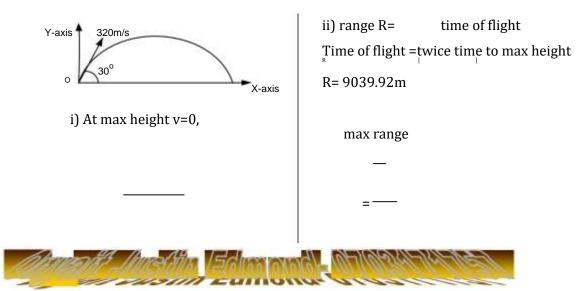

Solution

25

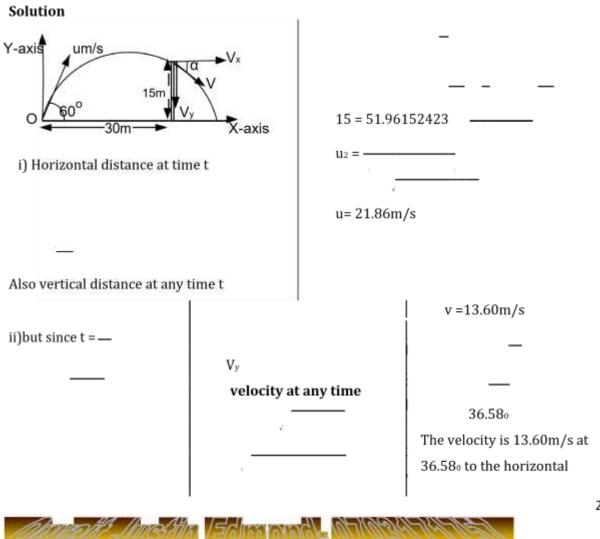

A projectile fired at an angle of 60^o above the horizontal strikes a building 30m away at a point 15m above the point of projection. Find

Speed of projection

Velocity when it strikes a building

A body is projected at an angle of 60° above horizontal and passes through a net after 10s. Find the horizontal and vertical distance moved by the body after it, was projected at a speed of 20m/s

)

UNEB MARCH 1998 NO 1c

A ball is kicked from the spot 30m from the goal post with a velocity of 20m/s at 30_0 to the horizontal. The ball just clears the horizontal bar of a goal post. Find;

Height of the goal post

z = 5.33m The ball 5.33m behind the goal

EXERCISE 3

1. A particle is projected at an angle of 60_{\circ} to the horizontal with a velocity of 20m/s. calculate

the greatest height the particle attains **An[15.29m]**

A particle is projected from level ground towards a vertical pole, 4m high and 30m away from the point of projection. It just passes the pole in one second. Find

i) Its initial speed and angle of projection An [39.29m/s, 16.5₀] ii) The distance beyond the pole where the particle will fall An [24.42m]

A stone thrown upwards at an angle θ to the horizontal with speed ums-1 just clears a vertical wall 4m high and 10m from the point of projection when travelling horizontally. Find the angle of projection **An[38.66**]

A particle is projected with a velocity of 30m/s at an angle of 40_0 above the horizontal plane. find ;

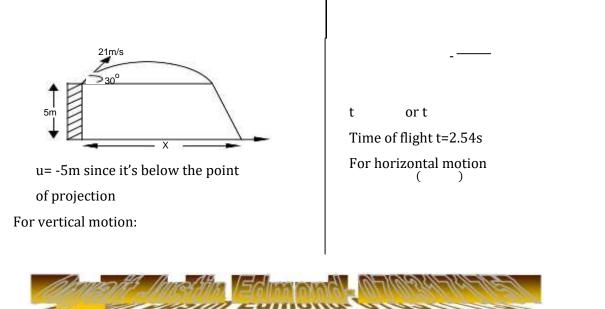

The time for which the particle is in the air.

b) The horizontal distance it travels An [3.9s, 22.9m/s]

Objects projected upwards from a point above the ground at an angle to the horizontal

A particle is projected at an angle of elevation of 30^o with a speed of 21m/s. If the point of projection is 5m above the horizontal ground, find the horizontal distance that the particle travels before striking the ground

Solution

The horizontal distance = 46.19m **Alternatively use equation of trajectory but not y=-5m**

A bullet is fired from a gun placed at a height of 200m with a velocity of $150ms_{-1}$ at an angle of 30_0 to the horizontal find

Maximum height attained

Time taken for the bullet to hit the ground

Solution

The max height attained is 286.70m from

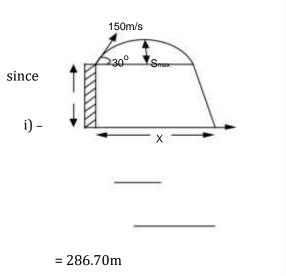

29

the point of projection

Examples

30

ii) Time taken for the bullet to hit the groundVertical motion :200mits below the point of projection

Time taken is 17.61s

EXERCISE 4

- A particle is projected with a velocity of 10ms-1 at an angle of 450 to the horizontal, it hits the ground at a point which is 3m below its point of projection. Find the time fro which it is in the air and the horizontal distance covered by the particle in this time **An[1.76s, 12.42m]**
- A pebble is thrown from the top of a cliff at a speed of 10m/s and at 30₀ above the horizontal. it hits the sea below the cliff 6.0s later , find;

The height of the cliff . An[150m, 52m]

The distance from the base of the cliff at which the pebble falls into the sea.

A pencil is accidentally knocked off the edge of a horizontal desktop. The height of the desk is 64.8cm and the pencil hits the floor a horizontal distance of 32.4cm from the edge of the desk, What was the speed of the pencil as it left the desk. **An[0.9ms**-1]

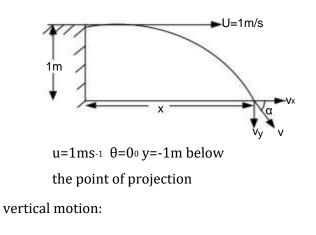

A ball rolls off the edge of a table top 1m high above the floor with a horizontal velocity 1ms-1. Find;

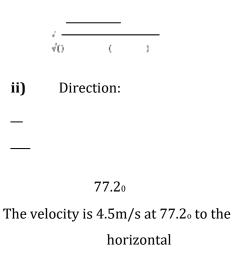

The time it takes to hit the floor

The horizontal distance it covered

The velocity when it hits the floor

Solution

iii) velocity when it hits the ground

A ball is thrown forward horizontally from the top of a cliff with a velocity of 10m/s. the height of a cliff above the ground is 45m. calculate

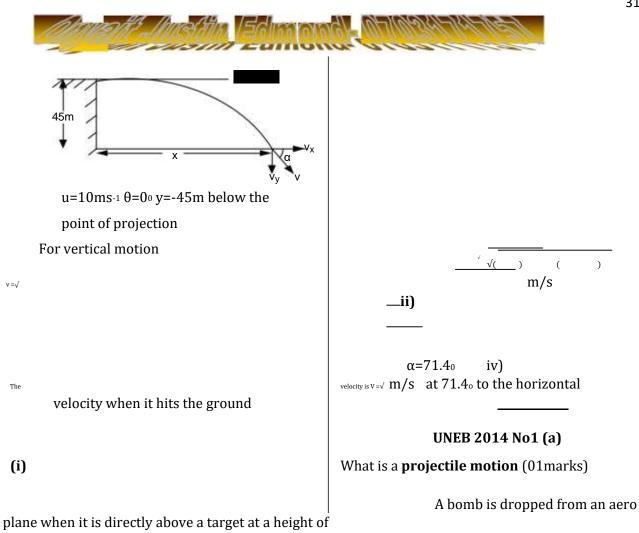

Time to reach the ground

Distance from the cliff where the ball hits the ground

Direction of the ball just before it hits the ground

Solution

CHAPTER 3: COMPOSITION AND RESOLUTION OF VECTORS 3.1.0: VECTOR QUANTITY

It is a physical quantity with both magnitude and direction.

Example; displacement, velocity, acceleration, force, weight and momentum

3.1.2: SCALAR QUANTITY

It is a physical quantity with only magnitude.

Example; distance, speed, time, temperature, mass and energy

3.1.3: VECTOR ADDITION

A. Vectors acting in the same line

If vectors are acting in the same direction then resultant along that direction is just the sum of

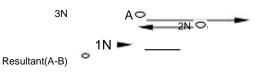

the two vectors.

B 2N

Resultant(A+B) o

If they are moving in the opposite direction then, the resultant is difference of the vectors but along the direction of the bigger vector.

B. vectors acting at an angle

With vectors inclined at an angle to each other, a triangle of vectors is used to find the resultant.

The resultant given by the line that completes the triangle.

Components of a vector

The component of a vector is the effective value of a vector a long a particular direction. The component along any direction is the magnitude of a vector multiplied by the **cosine of the angle** between its direction and the direction of the component.

34

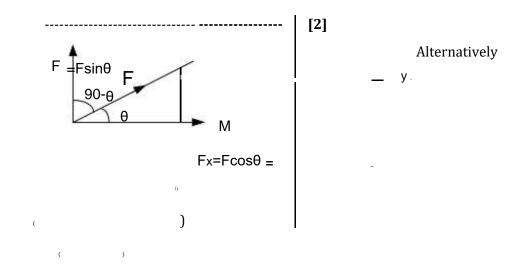

Suppose a force F pulls a body of mass m along a truck at an angle $\boldsymbol{\theta}$ to the horizontal as shown

below;

The effective force that makes the body move along the horizontal is the component of F along the horizontal

Hints

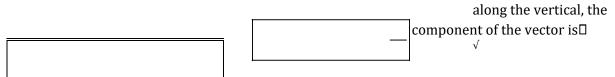

When a vector is inclined at an angle θ to the horizontal then;

along the horizontal, the component of the vector is□

along the vertical, the component of the vector is $\hfill\square$

When a vector is inclined at $\boldsymbol{\theta}$ to the vertical then;

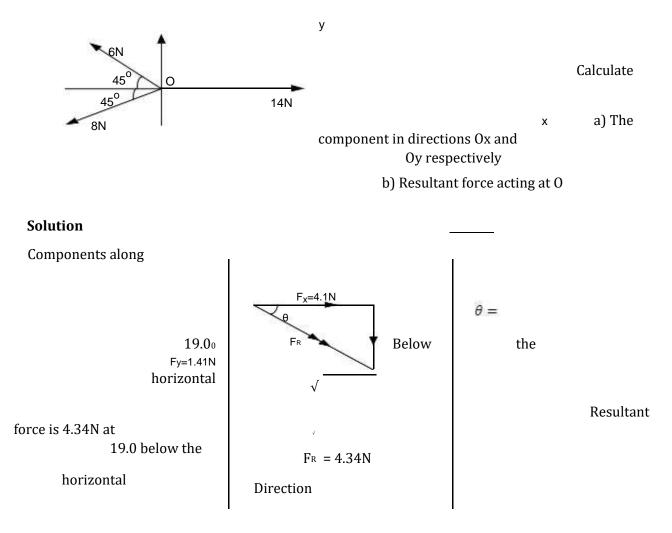

along the horizontal, the component of the vector is $\mbox{\tt D}$

Examples

1. Three forces are applied to a point as shown below

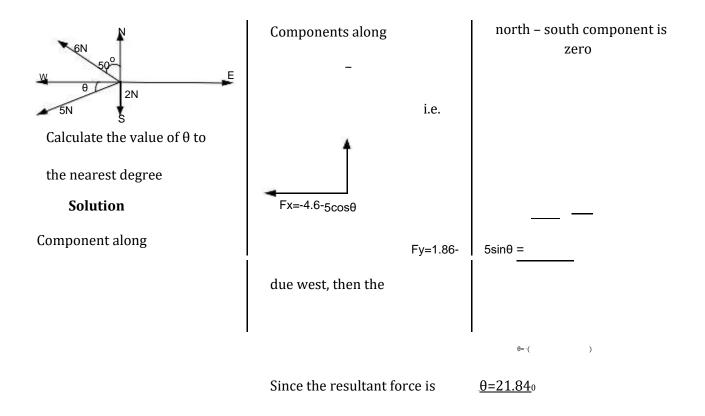

Component along

A particle is acted upon by three coplanar forces, the resultant force is in the direction due west

Ecolebooks

36

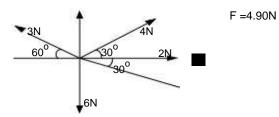

Forces of 2N, 4N, 3N, 6N, and 7N act on a particle in the direction 0₀, 30₀, 120₀, 270₀ and 330₀ respectively. Find the magnitude and direction of a single force represented by the above forces.

Solution

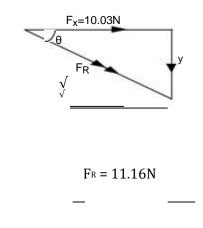

Note.

The direction given has 1, 2, 3 digit values therefore, the direction is in form of angles and hence they should be read anticlockwise from the positive x-axis

Resultant component along x-axis

Resultant component along y-axis

 $\theta = 26.04_{0}$

The resultant force is 11.16Nat 26.040 below the horizontal.

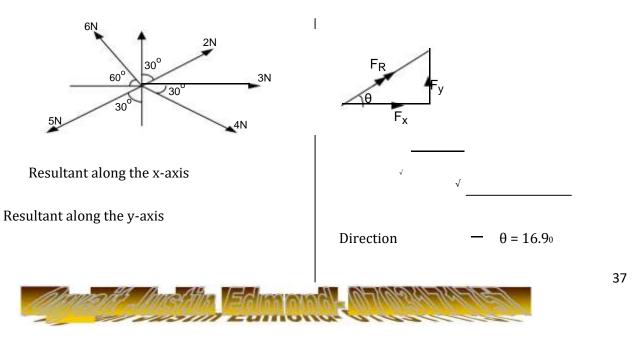

Forces of 2N, 3N, 4N, 5N, and 6N act on a particle in the direction $030_0,\,090_0,\,120_0,\,210_0,$ and

330^o respectively. Find the resultant force.

Solution

Note

The direction are given in 3-digit values, therefore they are bearings and must be measured from the north (positive y-axis) clock wise.

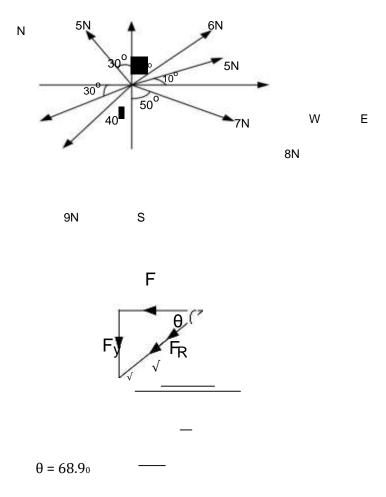

Ecolebooks.com

The resultant force is 2.053N at 16.90 above the horizontal

Forces of 6N, 5N, 7N, 8N, 5N, and 9N act pm a particle in the direction N30₀E, N30₀W, S50₀E, N60₀W, N80₀E and s40₀w, respectively. find the resultant force.

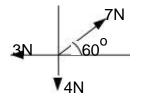

Resultant force is 5.36N at 68.90 below horizontal

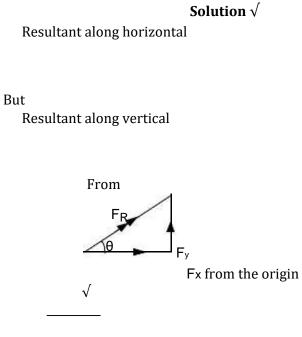

A particle at the origin 0 is acted upon by the three forces as shown below. Find the position of the particle after 2 seconds of its mass is 1kg.

х

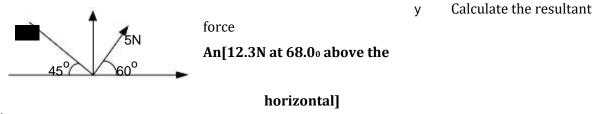

38

1. Two coplanar forces act on a point 0 as shown below

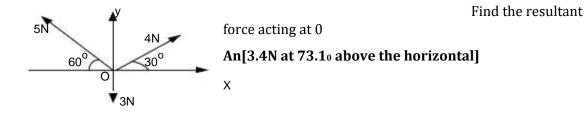

Х

2. Three coplanar forces act at a point as shown below

Ecoletooks

39

Forces of 2N, 1N, 3N and 4N act on a particle in the directions 0₀, 90₀, 270₀ and 330₀ respectively. Find the magnitude and direction of the resultant force.

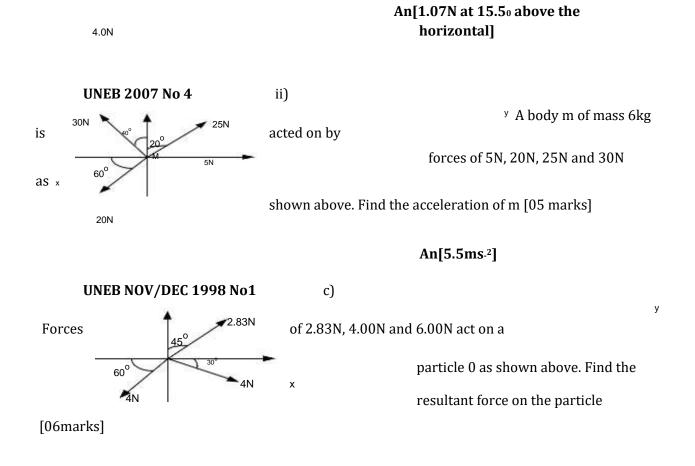

An[6.77N at 36.20 below the horizontal]

Forces of 7N, 2N, 2N, and 5N act on a particle in the direction 060₀, 160₀, 200₀ and 315₀ respectively. Find the resultant force. **An[4.14N at 52.36₀ below the horizontal]**

Three forces act on a body of mass 0.5kg as shown is the diagram. Find the position of the particle after 4 seconds.

resultant force. (4marks)

3.2.0: RELATIVE MOTION

It comprises of; 1-Relative velocity 2-Relative path

3.2.1: Relative velocity

This is the velocity a body would have as seen by an observer on another body. Suppose A and B are two moving bodies, the velocity of A relative to B is the velocity of A as it appears to an observer on B. It's denoted by ${}_{A}V_{B} = V_{A}-V_{B}$

Note that $AV_B = BVA$ since [BVA = VB - VA]

Numerical calculations There are two methods used in calculations Geometric method Vectorial method

40

41

1. Geometrical method

In this method make sure that the velocities of moving objects originates from a common point and their relative velocity closes to form a triangle of velocities.

Note

В

The direction of the relative velocity must be from the observer because it's the one observing where the other object is moving.

AVB O

А

Apply either cosine formula or sine formula to obtain the unknown quantities

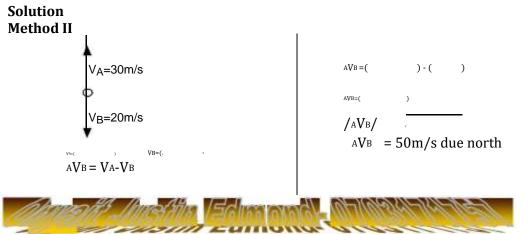

and _____

2. Vector method

Find component of velocity for each object separately Therefore $_{A}V_{B} = V_{A}-V_{B}$

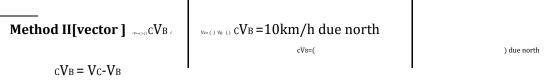

Example

1. Particle A is moving due to north at 30ms-1 and particle B is moving due south at 20m/s. find the velocity of A relative to B.

A cruiser is moving at 30km/hr due north and a battleship is moving at 20km/hr due north, find the velocity of the cruiser relative to the battleship.

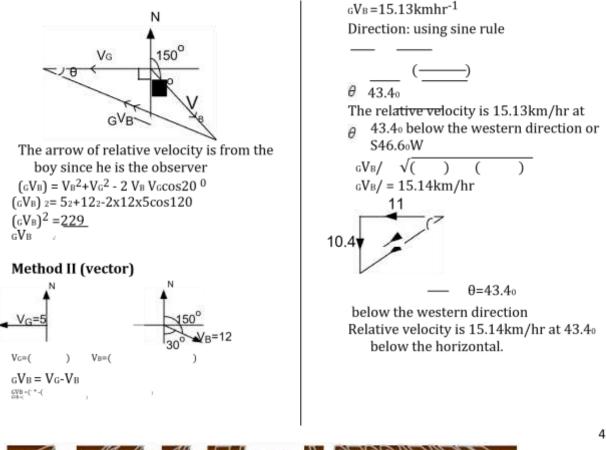

Solution

A particle A has a velocity of 4i+6j-5k (m/s) while particle B has a velocity of -

10i-2j+6k (m/s). find the velocity of A relative to B Solution AVB = VA - VBAVB $(+ (+ AV_B = 14i + 8j$ аVв 11k(m/s)

4. A boy runs at 5km/h due west and a girl runs 12km/hr at a bearing of 150₀. Find the velocity of the girl relative to the boy. **Method I [geometrical]**

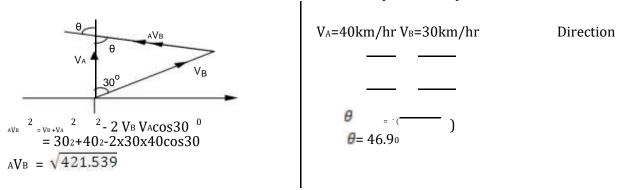

42

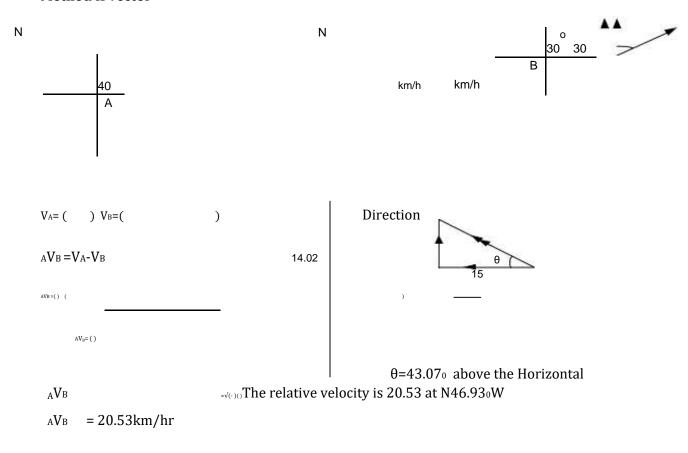

Plane A is flying due north at 40km/hr while plane B is flying in the direction N30₀E at 30km/hr. Find the velocity of A relative to B.

Solution

Method I (Geometric)

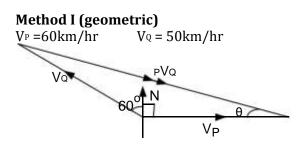

The relative velocity is 20.53 km/hr in the direction N46.9 W or S46.9 E $_{\rm AVB}$ = 20.53km/hr

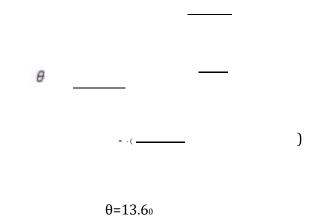

Ship P is steaming at 60km/hr due east while ship Q is steaming in the direction N60₀W at 50km/hr. Find the velocity of P relative to Q.

Method II vector

 $\begin{array}{l} {}_{p}V_{q}{}^{2} \ V_{p}{}^{2} + V_{q}{}^{2} & 2V_{p}V_{q}cos150 \\ {}_{p}V_{q}{}^{2} \ 60{}^{2} + 50{}^{2} & 2x60x50cos150 \\ {}_{p}V_{q} \ 106.3 km/hr \end{array}$

S76.40E Velocity of p relative to q is 106.3km/hr at S76.40E.

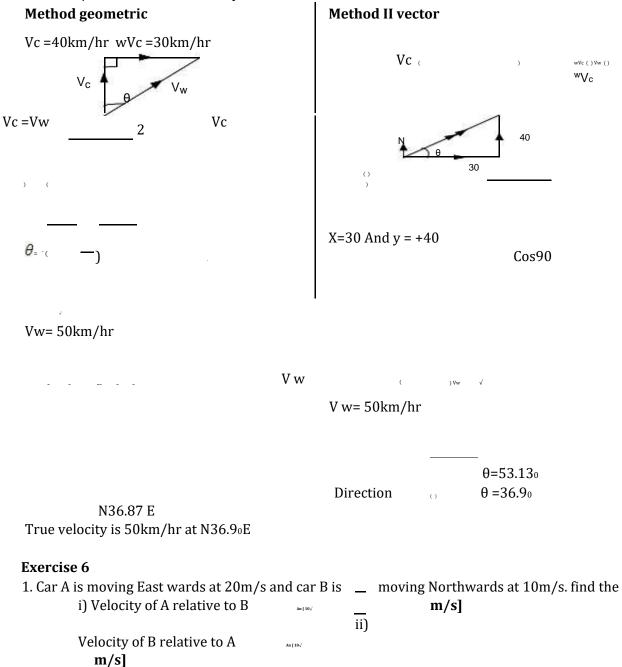

Method II vector

CHAPTER 4: NEWTON'S LAWS OF MOTION

LAW I : Everybody continues in its state of rest or uniform motion in **a straight line** unless acted upon by an external force.

This is sometimes called the law of inertia

Definition

Inertia is the reluctance of a body to start moving once its at rest or to stop moving if its already in motion.

LAW II: The rate of change of momentum of a body is directly proportional to the applied force and takes place in the direction of the force.

Definition

Linear momentum (p) is the product of the mass and the velocity of the body moving in a straight line.

Momentum is a vector quantity and its unit is kgms-1

Consider a mass m moving with velocity u. If the mass is acted on by a force F and its velocity changes to v;

 By Newton's law of motion
 $F = ___$

 But a
 But a

 F
 But a

 F
 But a

 F
 But a

 Where k is a constant
 The unit of force is a newton

 Definition
 A Newton is a force which gives a body of mass 1kg an acceleration of 1ms_{-2}

 F= 1N, m = 1kg, a = 1ms_{-2} But F = kma

 1 = Kx1x1
 K=1

Note: F must be the resultant force

LAW III: To every action there is an equal but opposite reactions.

This law stresses that whenever two bodies interact with each other, the force exerted by the first body on the second body is equal and opposite to the force exerted by the second body on the first body

Example of 3rd law of motion

A gun moves backwards on firing it.

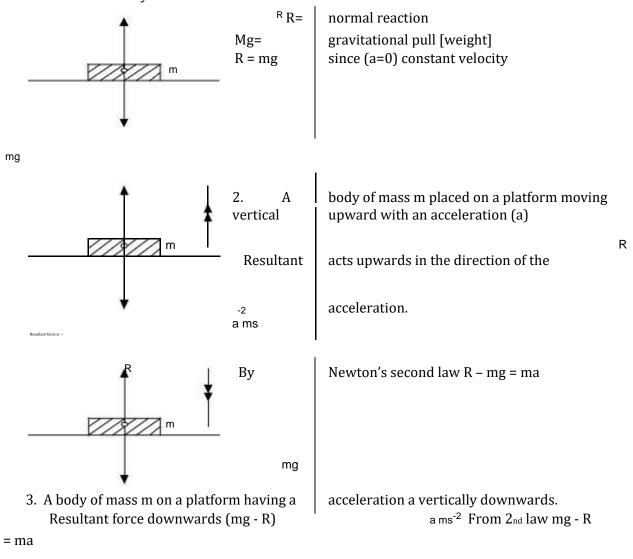

A ball bounces on hitting the ground.

NB: Though action and reaction forces are equal and opposite in direction, they do not cancel out because they act on different bodies.

4.1.0: IDENTIFICATION OF FORCES AND THE APPLICATION OF NEWTON'S LAWS

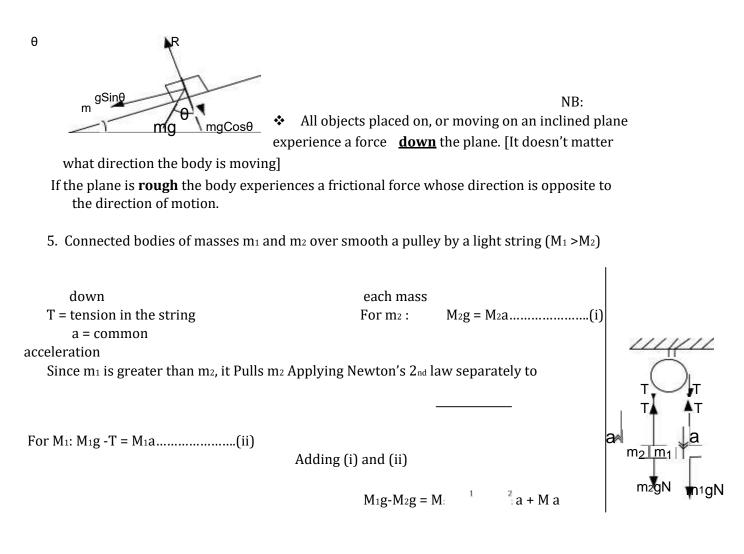

Consider a body of mass **m** placed on either a stationary platform or a platform moving at a constant velocity

mg

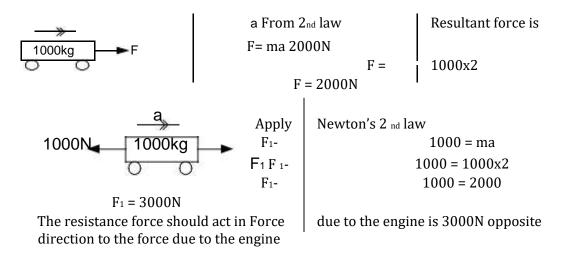

4. Mass m placed on a smooth inclined plane of angle of inclination

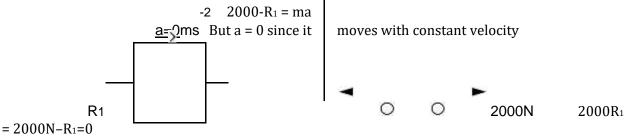

Examples:

A car of mass 1000kg is accelerating at 2ms-2. What resultant force acts on the car? . If the resistance to the motion is 1000N, what force is due to the engine? **Solution**

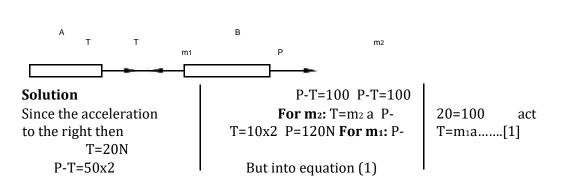

A car moves along a level road at a constant velocity of 22m/s. If its engine is exerting a forward force of 2000N, what resistance is the car experiencing

Applying Newton's 2nd law

Two blocks A and B connected as shown below on a horizontal friction less floor and pulled to the right with an acceleration of $2ms_2$ by a force P, if $m_1 = 50$ kg and $m_2 = 10$ kg. what are the values of T and P

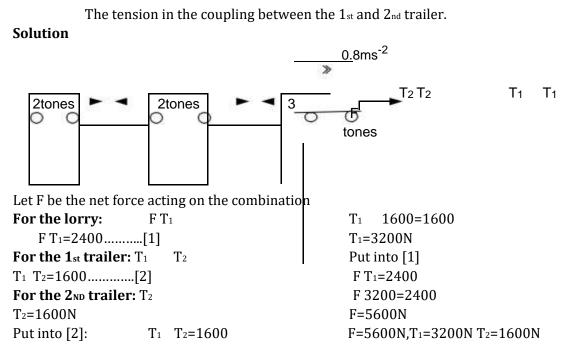

A Lorry of 3 tones pulls 2 trailers each of mass 2 tones along a horizontal road, if the lorry is accelerating at 0.8ms-2, calculate

Net force acting on the whole combination

The tension in the coupling between the lorry and $1_{\mbox{\scriptsize st}}$ trailer.

Exercise 10

A box of 50kg is pulled up from a ship with an acceleration of 1ms-2 by a vertical rope attached to it.

Find the tension on the rope. What is the tension in the rope when the box moves up with a uniform velocity of 1ms-1 (g=9.8ms-2) An [540N, 490N]

A lift moves up and down with an acceleration of 2ms-₂. In each case, calculate the reaction of the floor on a man of mass 50kg standing in the lift. (take g = 9.8ms-_s) **An[590N, 390N]**

Motion on inclined planes

Example

A body of mass 5kg is pulled up a smooth plane inclined at 30^o to the horizontal by a force of 40N acting parallel to the plane. Find

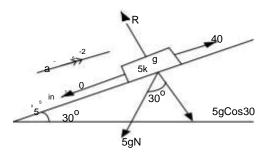

Acceleration of the body

Force exerted on the body by the plane

Solution

1.5.475 =5 a

= $3.095 \text{m/s}_2 a \approx 3.1 \text{ m/s}_2 \text{ Acceleration} \approx 3.1$

m/s 2

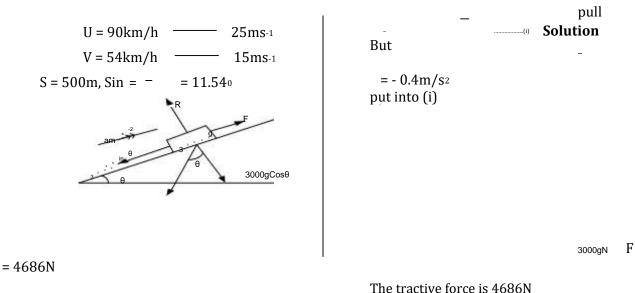

b) Force exerted on the body by the plane is the normal reaction

R = 42.4N

Since its moving up the plane, the resultant is upwards.

Resolving parallel to the plane

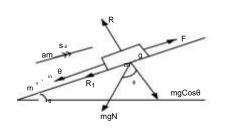

A lorry of mass 3 tones travelling at 90km/hr starts to climb an incline of 1 in 5. Assuming the tractive pull between its tyres and the road remains constant and that its velocity reduces to 54km/h in a distance of 500m. Find the tractive

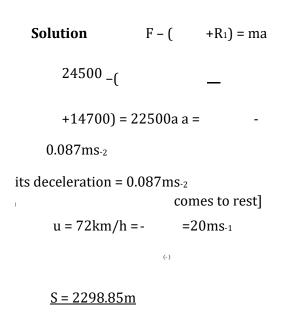

Let F be the tractive pull Resolving along the plane

A train travelling uniformly at 72km/h begins an ascent on 1 in 75. The tractive force which the engine exerts during the ascent is constant at 24.5kN, the resistance due to friction and air is also constant at 14.7kN, given the mass of the whole train is 225 tones. Find the distance a train moves up the plane before coming to rest.

1 in 75 means sin = -= 0.760resistance force: R1= 14.7kN tractive force :F = 24.5kN

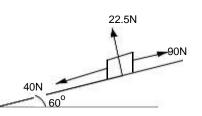

Exercise 11

- 1. The pull exerted by an engine is 1/80 of the weight of the whole train and the maximum brake force which can be exerted is 1/30 of the weight of the train. Find the time in which the train travels from the rest up a slope of 1 in 240 and 4800m along, if the
 - brakes are applied when the engine is switched off. An(379s).
- 2. The resistance to the motion of the train due to friction is equal to 1/160 of the weight of the train, if the train is travelling on a level road at 72kmh-1 and comes to the foot of an incline of 1 in 150 and steam is then turned off, how far will the train go up the incline before it comes to rest.

An(1579.99m)

- 3. 12m length of the slope. If the truck starts from the bottom of the slope with a speed of 18km/h, how far up will it travel before coming to rest An(71.43m).

A mass of 5kg is placed on a smooth horizontal table and connected by a light string to a 3kg mass passing over a smooth pulley at the edge of the table and hanging freely. If the system is allowed to move, calculate:

a) The common acceleration of the masses

An[3.68m/s₂]

- b) The tension in the string **An[18.4N]**
- c) The force acting on the pulley **An[26N]** 3.

The diagram shows a particle A of mass M = 2kg resting on a horizontal table. It is attached to particles B of m =5kg and C of m= 3kg by light inextensible strings hanging over light smooth pulleys. If the system is allowed to move from rest, find the common acceleration of the particle and the tension in each string given that the surface of the table is rough and the coefficient of friction between the particle and the surface of the table is ¹/₂ An[0.98ms-2, 32.37N, 44.15N]

С

[Hint: friction force = coefficient of friction x normal reaction]

4.1.2: LINEAR MOMENTUM AND IMPULSE

Momentum is the product of mass and velocity of the body moving in a straight line Momentum (p) = mass x velocity

Momentum is a

vector quantity

IMPULSE

This is the product of the force and time for which the force acts on a body i.e. Impulse (I) = Force(F) x time (t) =

The unit of impulse is Ns.

An impulse produces a change in momentum of a body. If a body of mass(m) has it velocity changed from u to v by a force F acting on it in time t, then from Newton's 2_{nd} law.

| F = | | I = mv-mu |
|-----------------------------|-------------|-----------|
| Ft = mv-mu Impulse = change | in momentum | |

Example

A body of mass 5kg is initially moving with a constant velocity of 2ms-1, when it experiences a force of 10N is 2s, find

The impulse given to the body by the force

The velocity of the body when the
20 = 5v-5x2
5v = 30force stops acting

= 20Ns v = 6m/s

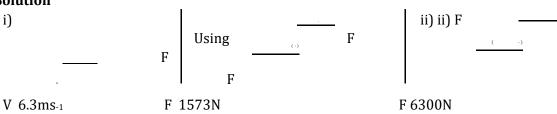

Impulse

A body of mass 50kg jumps onto the ground from a height of 2m. Calculate the force which acts on him when he lands

As he bends his knees and stops within 0.2 seconds

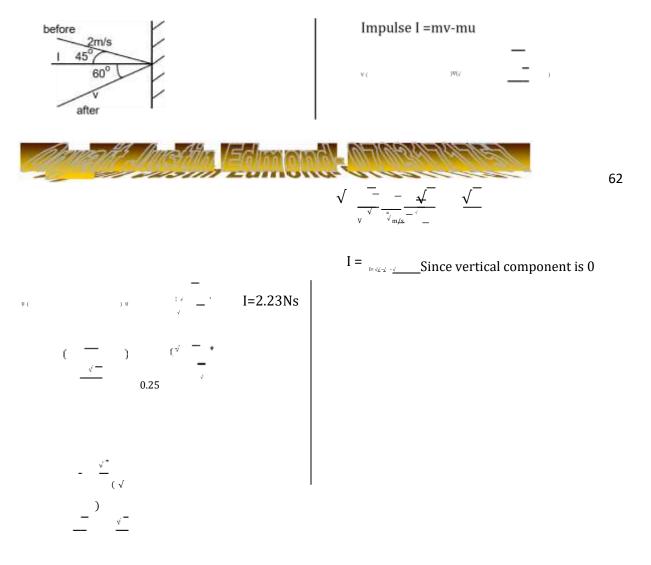

As he keeps his legs straight and stops within a shorter period of time of $0.05 \mbox{s}$

Solution

A ball of mass 0.25kg moving in a straight line with a speed of 2ms-1 strikes a vertical wall at an angle of 45° to the normal. The wall gives it an impulse I in the direction of the normal and the ball rebounds at an angle of 60° to the normal. Calculate the magnitude of the

impulse and the speed with which the ball rebounds. **Solution**

Since I is perpendicular to the wall then the vertical component is zero

4.1.3: WHY LONG JUMPER BEND KNEES

The force F exerted on a long jumper on coming to rest is F= ______ Since the change in momentum is constant. Therefore the knees are bent so as to increase the time taken to come to rest which reduces the rate of change of momentum, therefore the force on the jumpers legs is reduced thus less pain on the legs.

Question: Explain why, when catching a fast moving ball, the hands are drawn backwards while ball is being brought to rest.

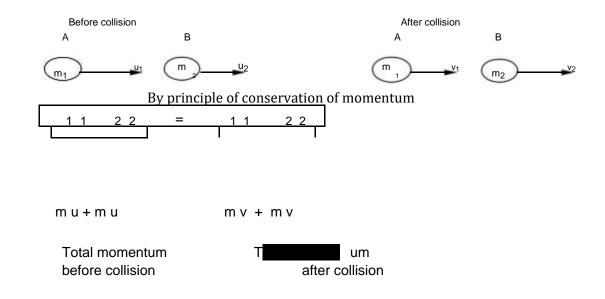

Question: Explain why a long jumper must land on sand

4.1.4: LAW OF CONSERVATION OF LINEAR MOMENTUM

It states that for a system of colliding bodies, their total momentum remains constant in a given direction provided no external force acts on them.

Ecolebooks

Suppose a body A of mass m, and velocity U_1 , collides with another body B of mass m_2 and velocity U_2 moving in the same direction

4.1.5: Proof of the law of conservation of momentum using Newton's law

Let two bodies A and B with masses m_1 and m_2 moving with initial velocities u_1 and u_2 and let their velocities after collision be v_1 and v_2 respectively for time t with ($v_1 < v_2$) By Newton's laws

| By Newton's | law: | | ¢ | | |) | (|
|-------------|----------|----------|----------|---|------|---------|----|
| Force on | : | <u> </u> | <u>'</u> | ä | | | |
| Force on | : | | | | | | |
| By Newton's | 3rd law: | | Hence | e | | constar | it |
| | | | | | | | |

4.1.6: COLLISIONS

- In an isolated system, momentum is always conserved but this is not always true of the kinetic energy of the colliding bodies.
- In many collisions, some of the kinetic energy is converted into other forms of energy such as heat, light and sound.

Types of collisions

1. Elastic collisions

It is also perfectly elastic collision. This is a type of collision in which all kinetic energy is conserved. collision between molecules, electrons.

2. Inelastic collision

This is a type of collision in which the kinetic energy is not conserved.

3. Completely inelastic collision

This is a type of collision in which the bodies stick together after impact and move with a common velocity. a bullet embedded in a target

Explosive collision (super elastic) This is

one where there is an increase in K.E.

Summary

Elastic collision

- Linear momentum is conserved
- Kinetic energy is conserved
- Bodies separate after collision
- Coefficient of restitution (elasticity)=1 (e=1)
- Inelastic collision✤ Linear momentum is conserved
- Kinetic energy is not conserved
- Bodies separate after collision
- Coefficient of restitution is less than 1 (e<1)

Perfectly inelastic

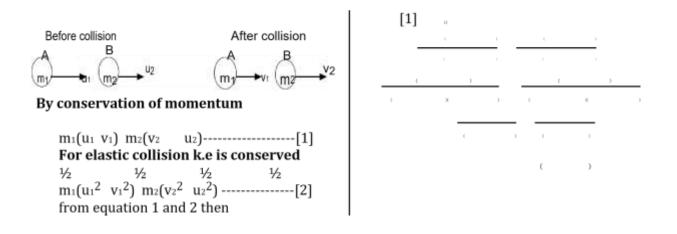

- Linear momentum is conserved
- Kinetic energy is not conserved
- Bodies stick together and move with a common velocity
- **☆** e=0

4. 1.7: Mathematic treatment of elastic collision

Consider an object of mass m, moving to the right with velocity u 1. If the object makes a headon elastic collision with another body of mass m2 moving with a velocity u2 in the same direction. Let v1 and v2 be the velocities of the two bodies after collision.

4.2.0: SOLID FRICTION

Friction is the force that opposes relative motion of two surfaces in contact.

4.2.1: Types of friction

There are two types of friction i.e. static friction and kinetic friction.

1. Static friction

It's a force that opposes the tendency of a body to slide over another. **Note**:

Limiting friction is the maximum frictional force between two surfaces in contact when relative motion is just starting.

2. Kinetic/sliding/dynamic friction

It's the force that opposes relative motion before two surfaces which are already in motion.

4.2.2: Laws of friction

 $\mathbf{1}_{st}$ **law**: Frictional forces between two surfaces in contact oppose their relative motion. $\mathbf{2}_{nd}$ **law**: Frictional forces are independent of the area of contact of the surfaces provided that normal reaction is constant.

3rd **law :** The limiting frictional force is directly proportional to the normal but independent of relative velocity of surfaces.

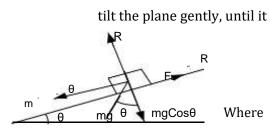

4.2.3: Molecular explanation for occurrence of friction

Actual area of contact of two surfaces is very small, hence the pressure at points of contact is very high. Projections merge to produce welding and the force which opposes motion is obtained. This explains law 1

The area of contact is small and the actual area of contact is the same. This explains law 2

Increasing weight increases the pressure at the welds and hence a greater limiting frictional force . This explains law 3

4.2.4: MEASUREMENT OF COEFFICIENT OF STATIC FRICTION Method I

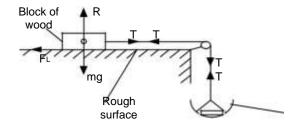

Place a block on a horizontal plane.

Method 2

just begins to slide.

Measure and record the angle of tilt $\boldsymbol{\theta}$

Coefficient of static friction θ is the angle of friction

Scale pan

75

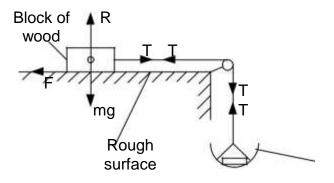

The mass m of the wooden block is determined and placed on a horizontal plane surface.

A string is attached to the block and passed over a smooth pulley carrying a scale pan at the other end.

Small masse are added to the scale pan one at a time, till the block just slides

The mass M of the scale pan and the masses added is obtained. Coefficient of static friction _____

4.2.5: Measurement of coefficient of kinetic friction

Scale pan

The mass m of the wooden block is determined and placed on a horizontal plane surface. A string is attached to the block and passed over a smooth pulley carrying a scale pan at the

other end.

Small masse are added to the scale pan one at a time, till the block moves with a uniform speed

The mass M of the scale pan and the masses added is obtained.

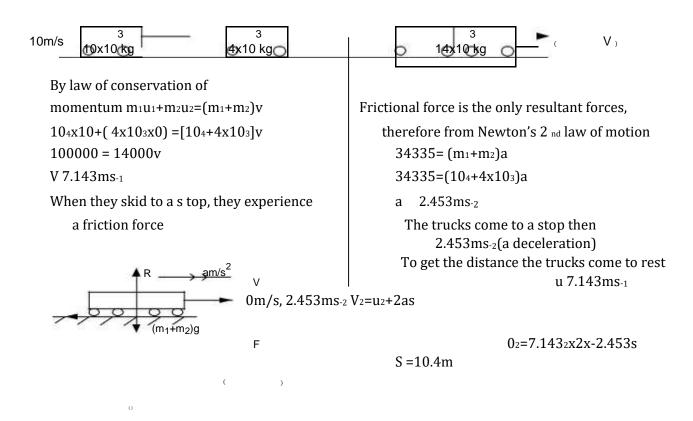

Coefficient of kinetic friction

EXAMPLES

A truck of mass 10 tones moving at 10ms-1 draws into a stationary truck of mass 4 tones. They stick together and skid to a stop a long a horizontal surface. Calculate the distance through which the trucks skid, if the coefficient of kinetic friction is 0.25. **Solution**

Before

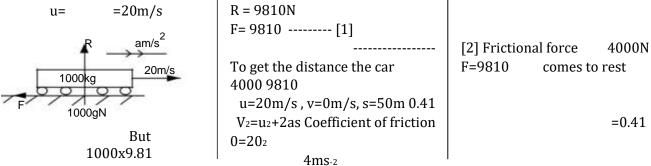

After

A car of mass 1000kg moving along a straight road with a speed of 72kmh-1 is brought to rest by a speedy application of brakes in a distance of 50m. Find the coefficient of kinetic friction

between the tyres and the road.

Solution

Two blocks of masses m₁=3kg and m₂=2kg are in contact on a horizontal table. A constant horizontal force F=5N is applied to the block of mass m₁ in the direction shown

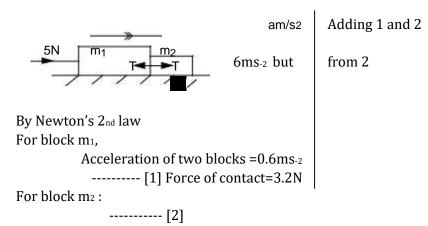

There is a constant frictional force of 2N between the table and the block of mass m_2 but no frictional force between the table and the block of mass m_1 . Find:

The acceleration of the two blocks

The force of contact between the blocks

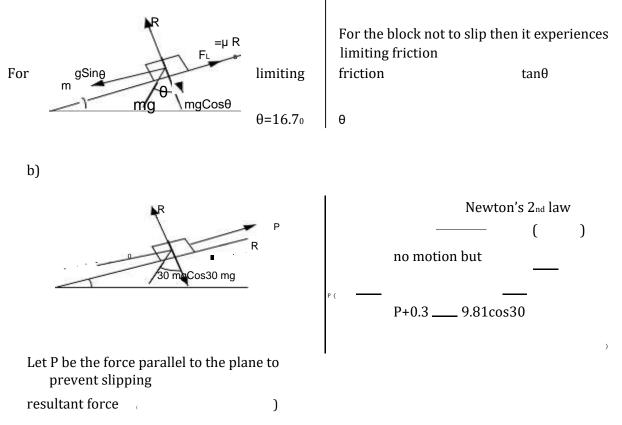

Solution

A block of wood of mass 150g rests on an inclined plane. If the coefficient of static friction between the surface of contact is 0.3. find;

The greatest angle to which the plane may be tilted without the block slipping The force parallel to the plane necessary to prevent slipping when the angle of the plane to the horizontal is 30₀.

Case 1

When a block of mass m rests on a smooth horizontal

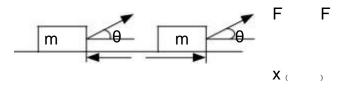

When a constant force F acts on the block and displaces it by x, then the work done by F is given by

Definition

Work is defined as the product of force and distance moved in the direction of the

force Case II

If the force does not act in the direction in which motion occurs but at an angle to the it as shown below

Definition

Work done is also defined as the product of the component of the force in the direction of motion and displacement in that direction

Note

Work done either can be positive or negative. If it is positive, then the force acts in the same direction of the displacement but negative if it acts oppositely.

The work done by friction when it opposes one body sliding over it is negative. Work and energy are scalar quantities and their S.I unit is Joules

Definition

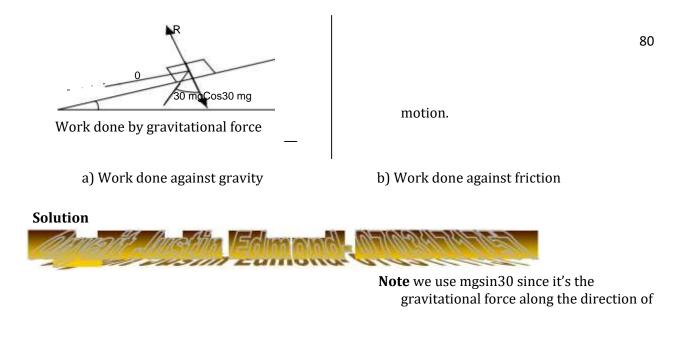

A joule is the work done when a force of 1N causes a displacement of 1m in the direction of motion

Dimension of work

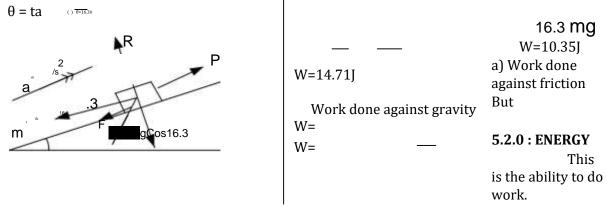

[] 00 = ML L [W] =

Examples

1. A block of mass 5kg is released from rest on a smooth plane inclined at an angle of 30_0 to the horizontal and slides through 10m. Find the work done by the gravitation force. **Solution**

A rough surface is inclined at ta () to the horizontal. A body of mass 5kg lies on the surface and is pulled at a uniform speed a distance of 75cm up the surface by a force acting along a line of greatest slope. The coefficient of friction between the body and the surface is ______
 Find;

When an interchange of energy occurs between two bodies, we can take the work done as measuring the quantity of energy transferred between them.

5.2.1: KINETIC ENERGY

Kinetic energy is the energy possessed by a body due to its motion.

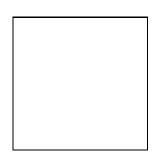

Formulae of kinetic energy

Consider a body of mass m accelerated from rest by a constant force, F so that in a distance, s it gains velocity, v

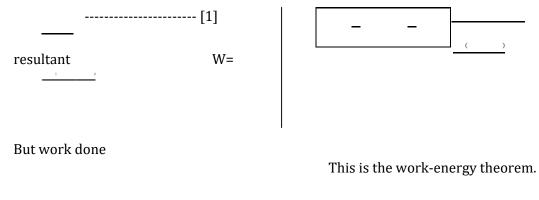

5.2.2: WORK-ENERGY THEOREM

The work energy theorem is the relation between work and energy.

Consider a body of mass m accelerated from u by a constant force F so that in a distance s it gains velocity v

()

It states that:

The work done by the resultant external force on a body is equal to the change in the kinetic energy of the body.

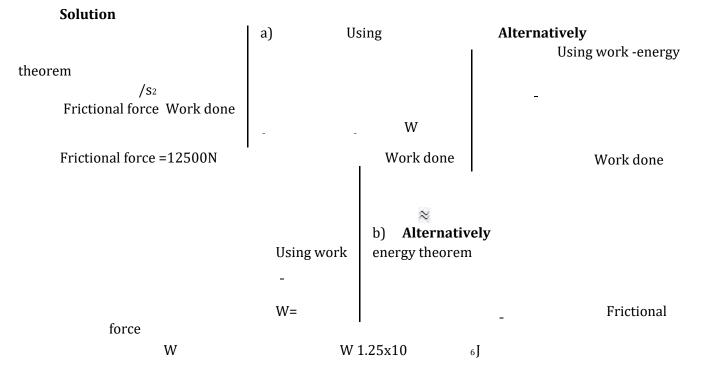

Question: Explain why it is easier to walk on a straight road than an inclined road up hill.

Examples

A car mass 1000kg moving at 50ms-1 skid to rest under a constant retardation. Calculate the magnitude of the work done by the force of friction given that the car.

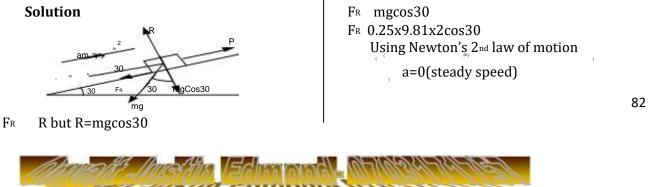

a) Comes to a halt in 4s

b) Skids through 150m

A force FN is used to drag a body of mass 2kg up a rough plane of angle 30_0 and whose coefficient of friction is 0.25 at a steady speed. If the force drags the body through a distance of

5m. Calculate the amount of work done by the force F F=14.06N W W

Work done FxS

5.2.3: GRAVITATIONAL POTENTIAL ENERGY

Potential energy is the energy that a body has due to its position in a gravitational field. Consider a body of mass m on the surface of the earth moved up a height h by a greater Force F.

Note

When a body is moving vertically upwards, it losses K.E but gains P.E and when moving downwards, it losses P.E and gains K.E

5.2.4: PRINCIPLES OF CONSERVATION OF MECHANICAL ENERGY

Mechanical energy includes kinetic energy, Gravitational potential energy and elastic potential energy.

Definition

Elastic potential energy is energy possessed by a stretched or compressed elastic material eg spring.

P.E (elastic)

Where k is the spring constant and e is the compression /extension

The principle of conservation of mechanical energy

States that in a <u>mechanical system</u> the total mechanical energy is a constant provided that the no <u>dissipative forces</u> act on the system.

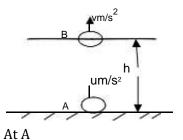

Examples of dissipative forces are;

Frictional force, air resistance, viscous drag

Examples of principle of conservation of

M.E i) A body thrown vertically upwards

Consider a body of mass m projected vertically upwards with speed u from a point on the ground. Suppose that it has a velocity v at a point B at a height h above the ground provided no

Total mechanical energy

Total mechanical energy By second equation of motion -----[1]

Put 2 into 1 [2] Total mechanical energy at B

> Since total mechanical energy at A is equal to the total mechanical energy at B. Hence a stone thrown vertically upwards obeys the principles of conservation of mechanical energy.

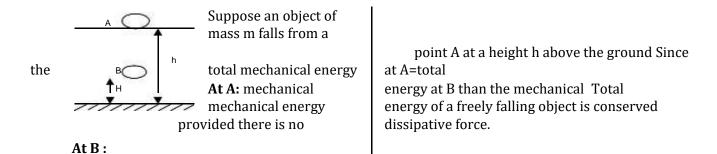

dissipative forces act.

()

83 ii) A body falling freely from a height above the ground

Total mechanical energy -- [1] But Newton's second law

5.2.5: CONSERVATIVE AND NON CONSERVATIVE FORCES

A conservative force is one where the work done in moving around a closed path in the field of force is zero.

Examples of conservative forces

Gravitational force Electrostatics force Magnetic force

A non-conservative force is one where the work done moving around a closed path in the field of force is not zero.

Examples of non- conservative force

Frictional force Air resistance Viscous drag

Differences between conservative forces and non- conservative forces

| Conservative forces | Non-conservative forces |
|--|---|
| Work done around a closed path is zero | Work done around a closed path is not zero |
| Work done to move a body from one point to another is independent on the path taken | Work done to move a body from one point to another is dependent on the path taken |
| Mechanical energy is conserved | Mechanical energy is not conserved |

5.3.0: POWER

It's the rate of doing work.

Its units are watts(W) or joule per second [Js-1]

=

Power

Р _____ Р ____

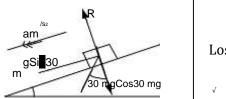

Dimensions of power

h u

Numerical examples

A 5kg mass is released from rest at the top of a smooth inclined plane. The angle of elevation of the incline is 30₀. What is the speed of the mass when it passes a point 20m down the incline.

Solution

Alternatively Loss in gain in

From Newton's 2nd law

2. A body of mass 6kg initially moving with speed 12ms-1

experiences a constant retarding force of 10N for 3s. find the kinetic energy of the body at the end of this time .

Solution

_ -10 is a retarding force

Final kinetic energy

[01mark]

Coplanar forces

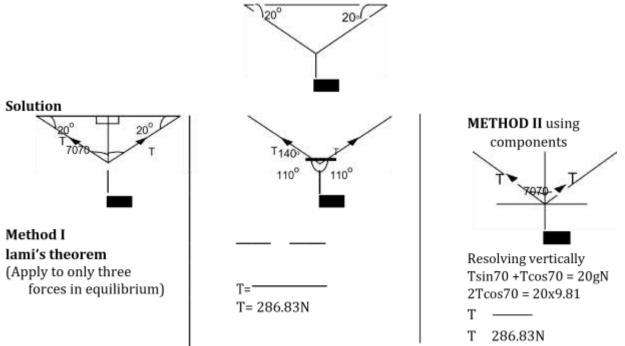

Those are forces acting on the same point (plane).

6.1.0: Conditions necessary for mechanical equilibrium

When forces act on a body then it will be in equilibrium when; the algebraic sum of all forces on a body in any direction is zero the algebraic sum of moments of all forces about any point is zero

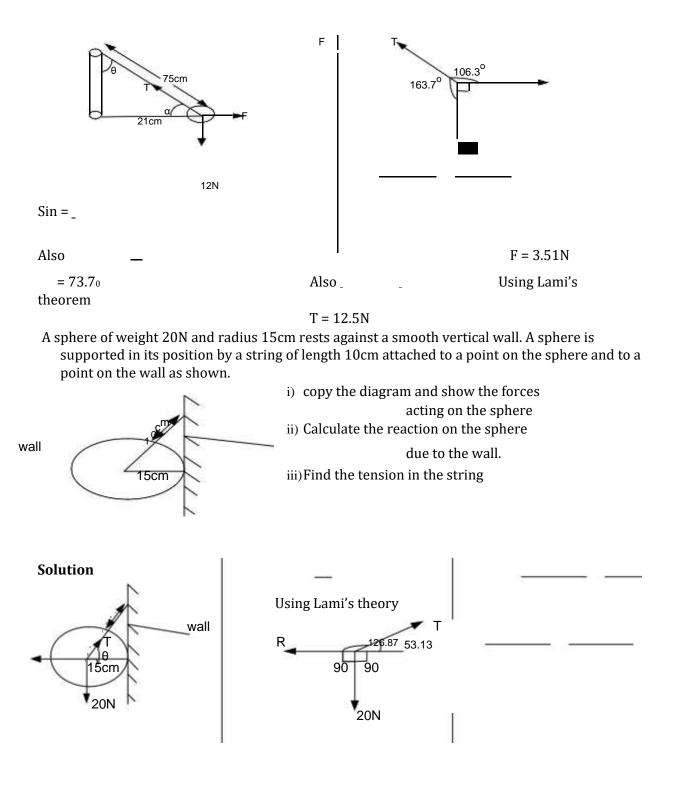

Examples

A mass of 20kg is hang from the midpoint P of a wire as shown below. Calculate the tension in the wire take g=9.8ms₋₁

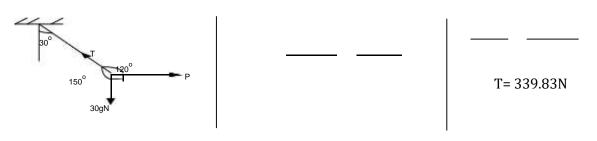

2. One end of a light in extensible string of length 75cm is fixed to a point on a vertical pole. A particle of weight 12N is attached to the other end of the string. The particle is held 21cm away from the pole by a horizontal force. Find the magnitude of the force and the tenion in the string

Solution

4. A mass of 30Kg hangs vertically at the end of a light string. If the mass is pulled aside by a horizontal force P so that the string makes an angle 30^o with the vertical. Find the magnitude of the force P and the tension in the string.

Solution

P = 169.91N

6.1.1: Types of equilibrium

Stable equilibrium.

This when a body returns to its equilibrium position after it has been slightly displaced

Unstable equilibrium.

This is when a body does not return to its equilibrium position and does not remain in the displaced position after it has been slightly displaced

Neutral equilibrium.

This is when a body stays in the displaced position after it has been slightly displaced

6.2.0: Turning effect of forces

A force can produce a turning effect or moment about a pivot, this can be a clockwise or anti clockwise turning effect.

6.2.1: Moment of a force

This is the product of a force and the perpendicular distance of its line of action from the pivot.

DOWNLOAD MORE RESOURCES LIKE THIS ON ECOLEBOOKS.COM

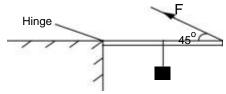

The unit of a moment is Nm and it's a vector quantity. Moment of a force Force x perpendicular distance of its line of action from pivot.

6.2.2: Principle `of moments

It states that when a body is in equilibrium, the sum of clockwise moments about a point is equal to the sum of anticlockwise moments about the same point.

Examples

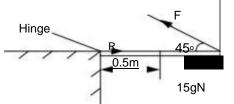

A hinged trapped door of mass 15kg and length 1m is to be opened by applying a force F at an angle of 45_0 as shown below.

Calculate

The value of F The horizontal force on the hinge

Solution

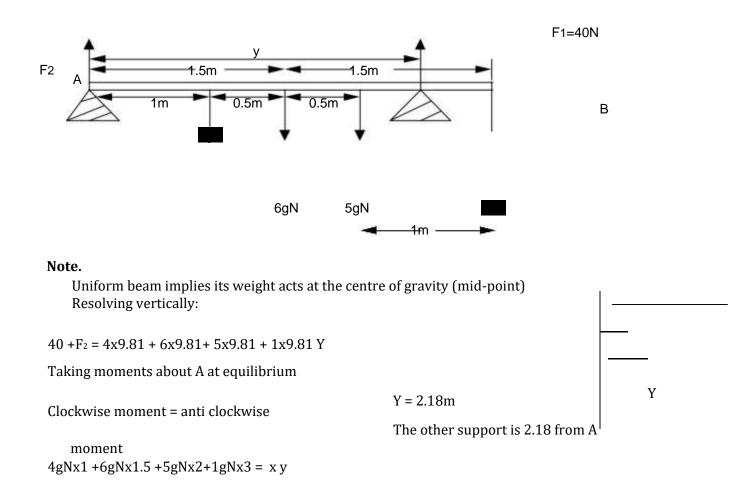

Anti<u>c</u>lockwise moments = clockwise Fsin45 F _____ 104.1N The horizontal force is the horizontal normal reaction Resolving horizontally:

CHAPTER 7: CIRCULAR MOTION

This is the motion of the body with a uniform speed around a circular path of fixed radius about a center.

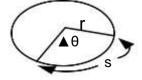

V

Although the body moves round this circular path with a uniform speed, the direction of motion changes as it moves from point A to B, C and so on around the path. Since the direction of motion changes, then the velocity of the body changes as it moves round circular path. This change in velocity results into an acceleration because acceleration is the rate of change in velocity.

Terms used in circular motion

Consider a body of mass m initially at point A moving with a constant speed in a circle of radius r to point B in a time Δt , the radius sweeps out an angle at the centre

Angular velocity (ω)

This is the is the rate of change of the angle for a body moving in a circular path. Mathematically $\boldsymbol{\omega}$

For large angles and big time intervals.

_

Angular velocity is measured in radians per second (rads-1)

2. Linear speed (v)

If the distance of the arc AB is, s and the speed is constant then velocity.

Definition

Velocity is the rate of change of displacement for a body moving a round a circular path about a fixed point or centre.

Period T

This is the time taken for the body to describe one complete are revolution

T _____ T ____ But T _____ T ____ Units seconds. Period is independent of the radius and it's constant.

4. Acceleration

Centripetal acceleration is defined as the rate of change of velocity of a body moving in a circular path and is always directed towards the centre.

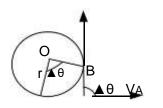

7.1.0: Derivation of Question:

Show that the acceleration of a body moving round a circular path with speed is given by where r is the radius of the path.

Solution

Consider a body of mass m moving around a circular path of radius r with uniform angular velocity and speed V. If initially the body is at point A moving with velocity V $_{\rm A}$ and after a small time internal t, the body is at point B where its velocity is V $_{\rm B}$ with the radius having moved an angle

Question

A volume of mass m is oscillated from a fixed point by a string of length r with a constant speed V.

Shows that the acceleration of the body is ____and directed towards the centre.

EXAMPLE

EXERCISE 18

A particle of mass 0.2kg moves in a circular path with an angular velocity of 5 rads-1 under the action of a centripetal force of 4N. What is the radius of the particle. **An(0.8m)**.

What force is required to cause a body of mass 3g to move in a circle of radius 2m at a constant rate of 4 revolutions per second. **An(3.8N)**

7.1.1: CENTRIPETAL AND CENTRIFUGAL FORCES

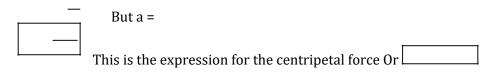

If a body is moving in a circle, it will experience an initial outward force called **centrifugal force**. These forces always act away from the center and are perpendicular to the direction of motion. In order for the body to continue moving in a circle without falling off, there must be an equal and opposite force to the centrifugal force. This force which counter balances the centrifugal force is called the **centripetal force** and always acts towards the center of the motion.

Definition

Centripetal force is a force which keeps a body moving in a circular path and is directed towards the center of the circular path.

If the mass of the body is m then the centripetal

force ma

Question

Explain why there must be a force acting on a particle which is moving with uniform speed in a circular path. Write down an expression for its magnitude. **Solution** If a body is moving along circular path, there must be a force acting on it, for if there were not, it would move in a straight line in accordance with Newton's first law. Furthermore, since a body is moving with a constant speed, this force cannot at any stage have a component in direction of motion of a body. For it did, it would increase or decrease the speed of the body. The force on the body must therefore be perpendicular to direction of motion and directed towards the center.

7.1.2: Examples of centripetal forces

A car moving around a circular truck: For a car negotiating a corner or moving on a circular path, the frictional force between the wheels and the surface provides the necessary centripetal force required to keep it on the track.

A car moving on banked track:

For a banked track, the centripetal force is provided by the frictional force and the horizontal components of the normal reaction.

a) **Tension on the string keeping a whirling body in a vertical circle**. The tension force in the string provides the necessary centripetal force

For the conical pendulum, the horizontal component of the tension in the

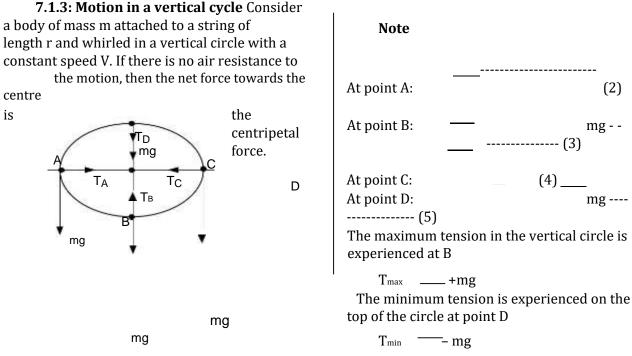

string provides the necessary centripetal force

Gravitational force on planets

For a planet orbiting round the sun or satellite revolving about the earth, the gravitational force between the two bodies provides the necessary centripetal force required to keep the satellite in the orbit.

Electrostatics force on the electrons

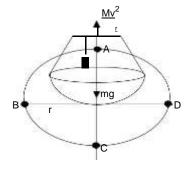

For electrons moving round the nucleus, the electrostatics force provides the necessary centripetal force.

If the speed of whirling is increased the string will most likely break at the bottom of the circle. Motion is tangential to the circle and when string breaks the mass will fly in a parabolic path.

Question

Explain why a bucket full of water can be swung round a vertical circle without spilling. Solution

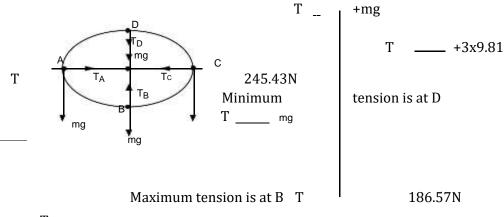

The water will only stay in the bucket if mg < . Consider a bucket at the top of the circle, if the weight, **mg** < , the normal reaction force N at the bottom of the bucket on the water provides the rest of the force on the bucket required to maintain the water in the circular path and therefore the

water will not spill. However if the bucket is swung slowly then Mg and the un used part of the weight causes the water to leave the bucket

Examples

1. An object of mass 3kg is whirled in a vertical circle of radius 2m with a constant sped of 12ms-1, calculate the maximum and minimum tension in the string **Solution**

T – mg _

A stone of mass 800g is attached to string of length 60cm which has a breaking tension of 20N. The string is whirled in a vertical circle the axis of rotation at a height of 100cm from the ground.

> What is the angular velocity where the string is most likely to break? How long will it take before the stone hits the ground?

Solution

 $\frac{1}{2}$ gt² (below the point of projection) $\frac{1}{2}$ x9.81t²

1/2 x9.81t2

t = 0.286s

EXERCISE 19

A body of mass 20kg is whirled in a horizontal circle using an inelastic string which has a breaking force of 400N. If the breaking speed is at $9ms_{-1}$. Calculate the angle which the string makes with the horizontal at the point of breaking. **An(\theta=29.3_0).**

A particle of mass 0.2kg is attached to one end of a light inextensible string of length 50cm. The particle moves in a horizontal circle with an angular velocity of 5.0rads₋₁ with the string inclined at θ to the vertical. Find the value of θ . An(370)

A particle of mass 0.25kg is attached to one end of a light in extensible string of length 3.0m. The particle moves in a horizontal circle and the string sweeps out the surface of a cone. The

maximum tension that the string can sustain is 12N. Find the maximum angular velocity of the particle. **An[4rads**-1].

A particle of mass 0.30kg moves with an angular velocity 0f 10rads-1 in a horizontal circle of radius 20cm inside a smooth hemispherical bowl. Find the reaction of the bowl on the particle and the radius of the bowl. An[6.7N, 22cm]

A child of mass 20kg sits on a stool tied to the end of an inextensible string 5m long, the other end of the string being tied to a fixed point. The child is whirled in a horizontal circle of radius 3m with a child not touching ground.

Draw a diagram to show the forces acting on the child Calculate the tension on the string

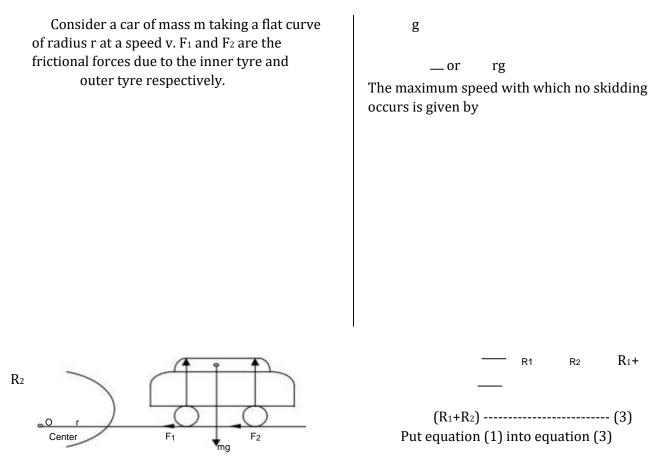

Calculate the speed of the child as it moves around the circle. An[245.25N, 4.695ms-1]

7.1.5: MOTION OF A CAR ROUND A FLAT CIRCULAR TRACK [NEGOTIATING A BEND]

Consider a car of mass m moving round a circular horizontal arc of radius r with a speed v

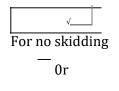

A) Skidding of the car

Skidding is the failure of a vehicle to negotiate a curve as a result of having a centripetal force less than the cent rifugal force and the car goes off the track or moves away from the centre of the circle.

mg

 $\begin{array}{l} R_1 \mbox{ and } R_2 \mbox{ are the normal reactions due to} \\ \mbox{inner and outer tyres respectively.} \\ \mbox{Resolving vertically : } R_1 + R_2 \mbox{ mg------ (1)} \\ \mbox{Resolving Horizontally: } F_1 + F_2 \mbox{ mg------ (2)} \\ \mbox{The frictional forces } F_1 \mbox{ and } F_2 \mbox{ provide the} \\ \mbox{necessary centripetal force But } F_1 \mbox{ R}_1 \mbox{ , } F_2 \\ \mbox{ R}_2 \end{array}$

Conditions for no skidding/side slips

For a car to go round a bend successfully without skidding then:

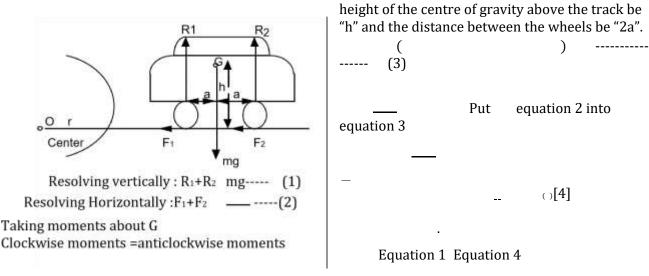

1- The speed should not exceed () or [$\sqrt{1-1}$

2- The radius of the bend should be made big

- 3- Coefficient of friction should be increased
- 4- Centre of gravity should be low

B) Overturning/toppling of a car

Consider a car of mass m moving around a horizontal (flat)circular bend of radius r at speed v. let the

Ways prevent toppling/overturning

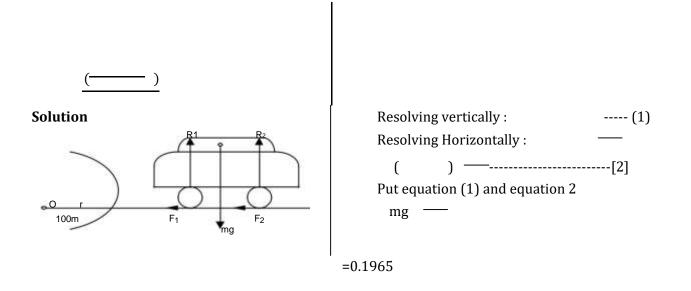

- i) Reduce the speed when negotiating a corner (
- _____) ii) Increase radius of a corner (r >

iii) The distance between the tyres should be made big (a >)iv Reduce distance from the ground to the centre of gravity (h) or C.O.G of the car should be low (h) _____

)

EXAMPLE

A car of mass 1000kg goes round a bend of radius 100m at a speed of 50km/hr without skidding. Determine the coefficient of friction between the tyres and the road surface

7.1.6: MOTION OF A CAR ON A BANKED TRACK

Definition

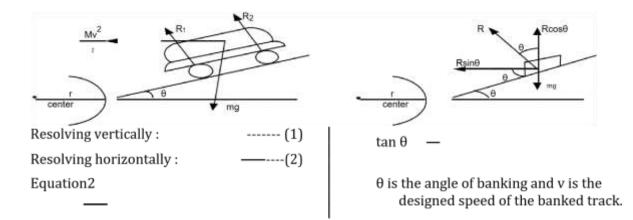

Banking a track is the raising of the outer part of the bend (corner) slightly above the inner part so as to ensure that only the horizontal component of normal reaction contributes towards the centripetal force.

Banking also enables the car to go round a bend at a higher speed for the same radius compared to a flat track.

A) NO SIDE SLIPP [No frictional force]

Consider a car of mass m negotiating a banked track at a speed v and radius of the bend is r. The car may be taken as aparticle on

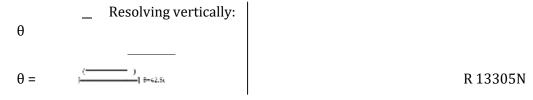

the incline

Examples

A racing car of mass 1000kg moves around a banked track at a constant speed of 108km/hr, the radius of the track is 100m. Calculate the angle of banking and the total reaction at the tyres.

Solution

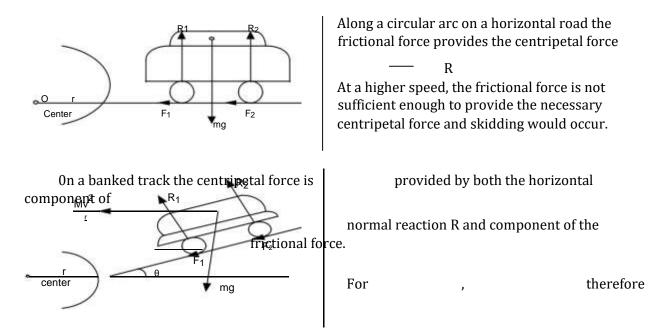

Exercise 20

A road banked at 10₀ goes round a bend of radius 70m. At what speed can a car travel round the bend without tending to side slip. **An[11ms**-1]

Question:

Explain why a car travels at a higher speed round a banked track without skidding unlike the flat tracks of the same radius. **Solution**

This is enough to keep the car on the track high speed.

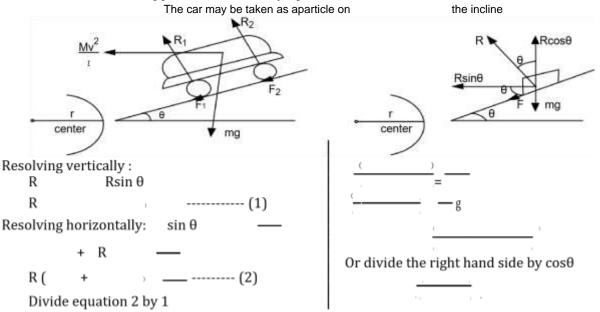

even at

B) FOR SKIDDING/SLIDE SLIPP

The frictional force must be there whose direction depends on the speed of the car.

i) MAXIMUM SPEED/GREATEST SPEED

If the car is moving at speed v, greater than the designed speed v, the force $Rsin\theta$ is enough to provide the necessary centripetal force. The car will tend to slid outwards from the circular path, the frictional force would therefore oppose their tendency up to the maximum value .

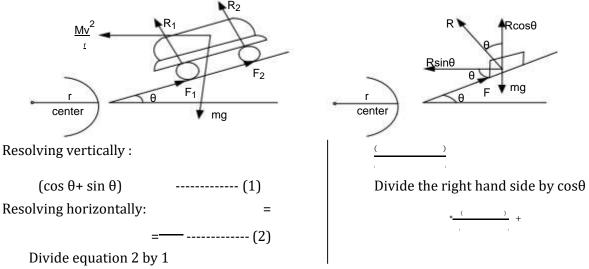

ii) MINIMUM SPEED/LEAST SPEED

If the speed v, is less than the designed speed v the component of the reaction produces an _acceleration greater than the centripetal acceleration () which is required to keep the car on circular path.

The car tends to slip down the banked track and this tendency is opposed by the frictional force acting upwards.

The car may be taken as aparticle on

the incline

Example

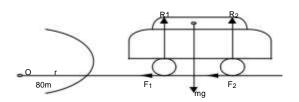

A car travels round a bend which is banked at 220. If the radius of the curve is 62.5m and the coefficient of friction between the road surface and tyres of the car is 0.3, calculate the maximum and minimum speed at which the car can negotiate the bend without skidding. **Solution**

22.15ms-1

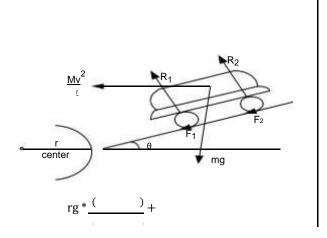

7.54ms-1

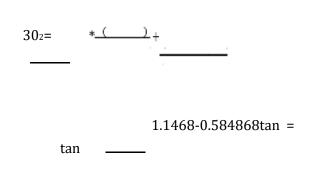

On a level race track, a car just goes round a bend of radius 80m at a speed of 20ms-1 without skidding. At what angle must the track be banked so that a speed of 30ms-1 can just be reached without skidding, the coefficient of friction being the same in both cases. **Solution Case I: of a level track**

For no skidding V_{max} v V_{max} v 202 =

Case II: on a banked track

EXERCISE 21

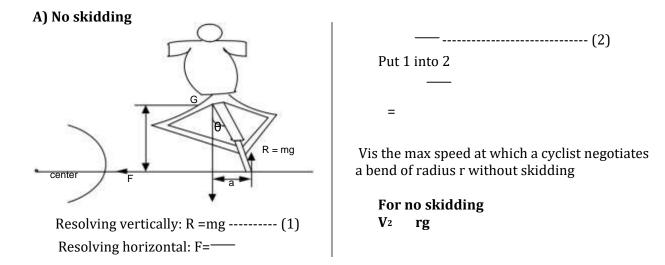

A racing car of mass 2 tonnes is moving at a speed of 5ms-1 round a circular path. If the radius of the track is 100m. calculate;

Angle of inclination of the track to the horizontal if the car does not tend to side slip The reaction to the wheel if it's assumed to be normal to the track. **An[1.5**, **19606.7N]**

A car travels round a bend banked at an angle of 22.60. if the radius of curvature of the bend is 62.5m and the coefficient of friction between the tyres of the car and the road surface is 0.3. Calculate the maximum and minimum speed at which the car negotiates the bend without skidding. An [22.38ms-1, 7.96ms-1]

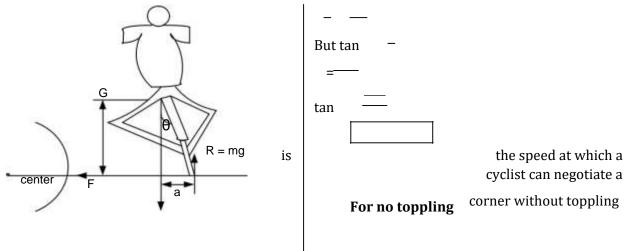

7.1.7: MOTION OF A CYCLIST ROUND A BEND

A cyclist must bend towards the centre while travelling round the bend to avoid toppling. When the cyclist bends, the weight creates a couple which opposes the turning effect of the centrifugal forces. Consider the total mass of the cyclist and his bike to be m round the circle of radius r at a speed v.

B) No toppling/over turning

The force G has a moment about the centre of gravity G(F.h) which tends to turn the rider out.

Taking moment about G

Why it is necessary for a bicycle rider moving round a circular path to lean towards a center of the path

When a rider moves round a circular path, the frictional force provides the centripetal force. The frictional force has a moment about the centre of gravity of the rider, the rider therefore tends to fall off from the centre of the path if this moment is not counter balanced. The rider therefore leans toward the center of the path so that his reaction provides a moment about the center of gravity, which counter balances the moment due to friction.

CHAPTER 8: GRAVITATION

Gravitation deals with motion of planets in a gravitational field. This motion is governed by laws among which are Kepler's laws of gravitation and Newton's laws of gravitation.

8.1.0: KEPLER'S LAWS OF GRAVITATION

- Law I: Planets describe elliptical orbit with the sun at one focus
- Law II: The imaginary line joining the sun and a planet sweeps out equal areas in equal time intervals
- **Law III**: The squares of the periods of revolution of a planet about the sun is directly proportional to the cube of the mean distance from the sun to the planet. $ieT_2\alpha r_3$

8.1.1: NEWTON'S LAWS OF GRAVITATION

It states that: the force of attraction between two bodies in the universe is directly proportional to the product of their masses and inversely proportional to the square of the distance between

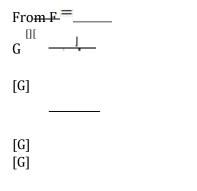

120

G is the gravitational constant G = $6.67 \times 10_{-11} Nm_2 kg_{-2}$ This law is sometimes called the inverse square law of gravitation.

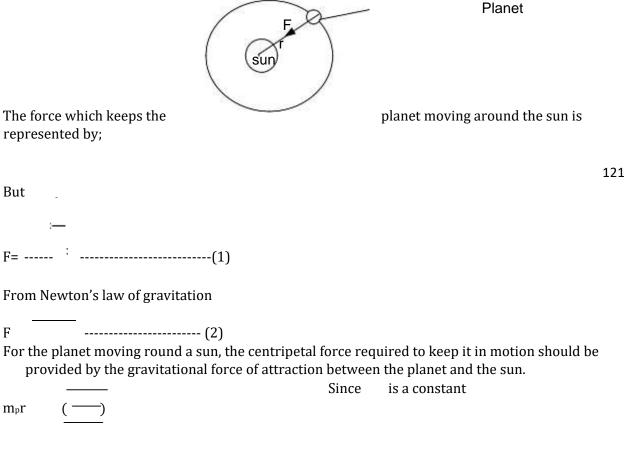

8.1.2: DIMENSION OF G AND ITS UNITS

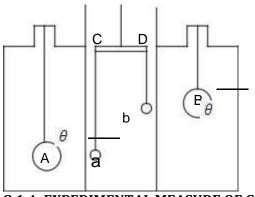

Units of G=kg-1m3S-2 or Nm2kg-2

8.1.3: VERIFICATION OF KEPLER'S 3RD LAW

Consider a planet of mass m_P above the sun of m_s . If the distance separating the planet and the sun is r.

8.1.4: EXPERIMENTAL MEASURE OF G

A, B- lead spheres

Note

Then torque of couple on CD = .But torque of couple = k k = . When A, B are brought near a, b respectively because of the attraction between the masses, two equal but opposite forces act on CD. The two forces form a couple and CD is deflected and the angle of deflection \$\theta\$ is. measured by a lamp and scale method by light reflected from CD.

The distance d between a, A and b, B when the deflection is θ , is measured. Then masses m, M of a and A respectively are measured

G = _____,

Where k is torsional constant

CD- highly polished bar

a, b -gold balls

- The high sensitivity of the quarts fibres enables the small deflection to be big enough to be measured accurately. The small size of the apparatus allowed it to be screened considerably from air convention currents.
- The constant k can be determined by allowing CD to oscillate through small angle and then observing its period of oscillation 'T' which was of the order of 3 minutes. If I is the known

moment of T=2 inertia of the system about the torsion wire

¢.

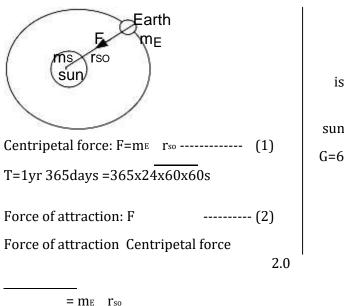

8.1.5: MASS OF THE SUN

The mass of the sun can be estimated by considering the motion of the earth round the sun in an orbit of radius 1.5×10^{11} m.

122

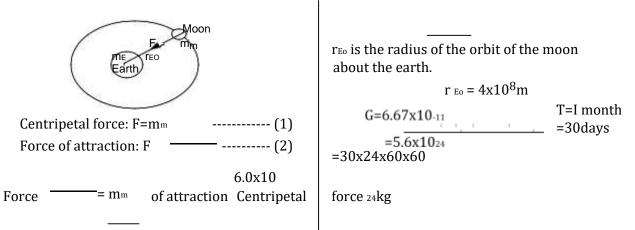

Ecoletooks

| But | |
|-----------|--------------------------------------|

| | Occurs due to forces of attraction between two bodies | Acts on only one body |
| 8.1.9: | Does not vary with attitude | Varies with attitude |

VARIATION OF g OF A BODY DURING FREE FALL

Variation of g with height above the earth's surface

An object of mass m placed at a height h, above [|] Therefore for a point above the earth the surface of the earth where acceleration due surface g varies inversely as the square to gravity at that height is

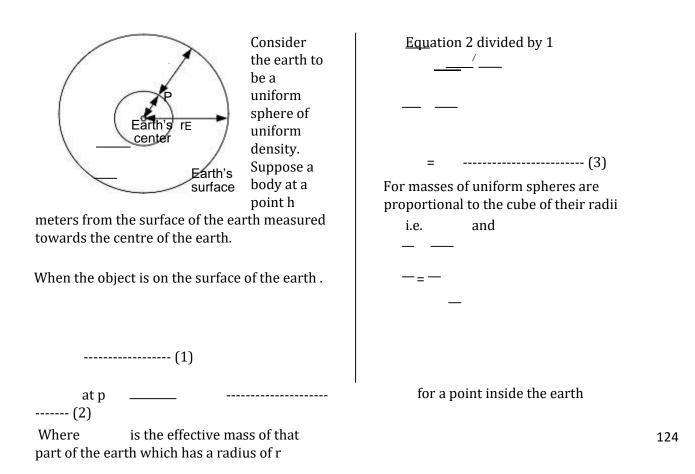

g 1. of the distance r from the centre of the

At a height h the gravitational force of earth.

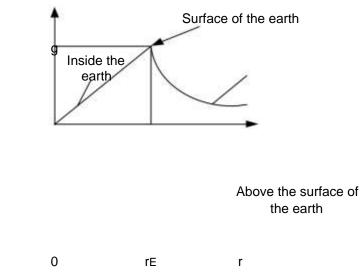

attraction between the object and the earth

is equal to the weight of the object.

2. Variation of g with depth below the earth surface

Graph of variation of acceleration of free fall from the centre of the earth

For points above the earth, the gravitational force obeys the inverse square law while for points inside the earth, g is proportional to the distance from the centre.

Variation of acceleration due to gravity with location on the surface of the earth

The earth is ellipsoidal with the equatorial radius being greater than the polar radius. At the

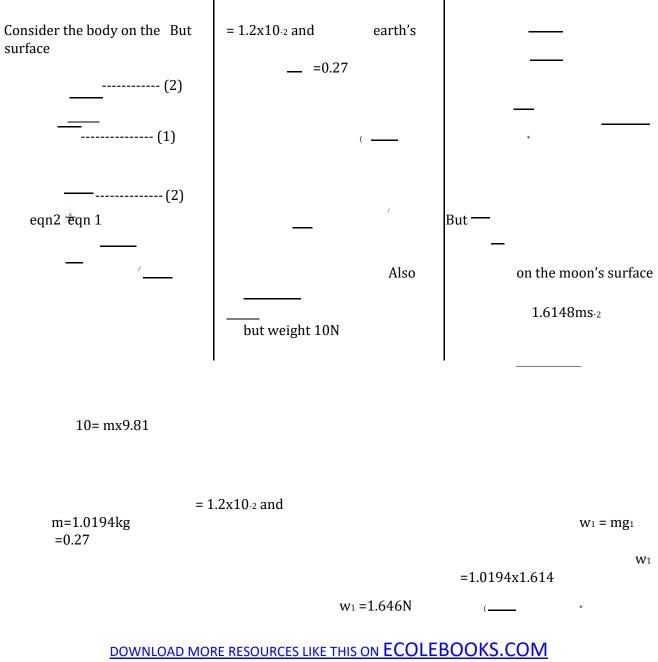

equator body is less attracted towards the earth than at the poles : $g_{equatorial} g_{polar}$ The earth rotates about its polar axis, so a body at the poles is practically stationary while towards the equator experiences a centripetal force $m\omega_2r$ where r is the equatorial radius.

m r = mg polar mg equatorial g polar r

Examples

1. A body has a weight of 10N on the earth. What will its weight be on the moon if the ratio of the moon's mass to the earth's mass is $1.2 \times 10_{-2}$ and the ratio of the moon's radius to that of the earth is 0.27?

Solution

Alternatively

_____(1)

125

2. The acceleration due to gravity on the surface of mars is about 0.4 times the acceleration due to gravity on the surface of the earth. How much wound a body weigh on the surface of mars if it weighs 800N on the earth's surface .

Solution W_m =0.4mg W_m =mg¹ W_m =0.4x800 But g₁=0.4g W_m =320N

since mg=800N

8.2.0: MOTION OF SATELLITE

 $W_m = mx0.4g$

A satellite is a small body that moves in space round a planet

There are two types of satellite□

1- Natural satellites eg moon

2- Artificial satellites eg Canal France International (CFI)

Artificial satellites are man made called space crafts/ space stations placed in orbits about the earth, moon or other planets for communication and scientific study purposes.

Artificial satellites are grouped into□

Passive satellites, for these satellites, they simply reflect signals of the same strength from one point to another.

Active satellites, these satellites are able to amplify and retransmit signal that they pick from one point on the earth to another.

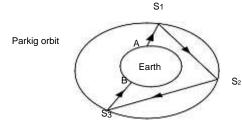

Satellites are initially fired from the earth into space with the help of a rocket. When a rocket reaches that particular height, a second phase of the launch is initiated where the satellite is fired horizontally into the orbit to start its circular motion and the rest of the rocket burns in space.

8.2.1: GEOSTATIONARY/SYNCHRONOUS ORBIT

These are communication satellites with orbital period of 24hrs and stays at the same point above the earth surface provided it is above the equator and its moving in the same direction as the earth is rotating.

Satellites of this type are used to relay television signals and telephone messages from one point on the earth surface to another eg synchrom2, synchrom3 and the early bind.

8.2.2: HOW COMMUNICATION IS DONE USING A SATELLITE

It is done by launching three or more geostationary communication satellites into space with help of a rocket.

Microwave signals are transmitted from a large steerable horn antennae A to the geostationary satellites S₁. satellite S₁ has a number of aerials which receives them and amplify and retransmit them to satellite S₂, which in turn transmits then back to the earth and they are received by steerable dish aerial in an earth station.

8.2.3: PARKING ORBIT

It's a path in space of a satellite which makes it appear to be in same position with respect to a point on the earth.

Note:

For an object (satellite) in parking orbit;

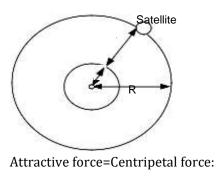

It has a period of 24hrs

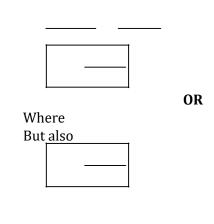

Angular velocity relative to that of the earth is zero

Direction of the object in the orbit is the same as the direction of rotation of the earth orbit about its axis.

8.2.4: PERIOD OF A SATELLITE

Consider a satellite of mass m moving in a circular orbit of radius h above the earth surface.

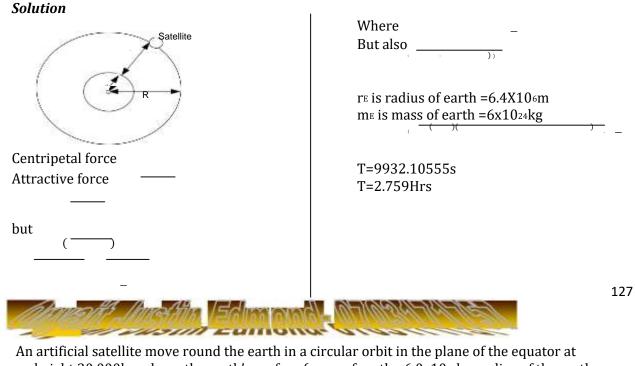

Example

Find the period of revolution of a satellite moving in a circular orbit round the earth at a height of 3.6×10^{6} m above the earth's surface.

Ecolebooks

An artificial satellite move round the earth in a circular orbit in the plane of the equator at height 30,000km above the earth's surface (mass of earth =6.0x10₂₄kg, radius of the earth= 6.4x10₆m,)

Calculate its speed

What is the time between successive appearances over a point on the equator What will be the additional distance of the satellite if it was to appear stationery **Solution**

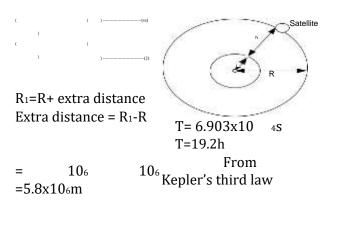

| | (x) |
|--|--|
| | $R=R_E+h$ |
| | $R=(6.4x10_6+3x10_7)m$ |
| | R=36.4 x106m |
| 8x107m, re= m Nm2kg-2 Me=6.0x1024kg | 19.2 ₂ =k(36.4 x10 ₆) ₃ (1) If the satellite is stationery, then the geostationary T ₁ =24hrs |

(ii) Time required is the period

h=30,000km =3x107m, re=

A communication satellite orbits the earth in synchronous orbits. Calculate the height of communication satellite above the earth.

 $R=4.22x10_{7}m$ But R=R_E R=6.4x10₆+h h=4.22x10₇ 6.4x10₆ h=3.58 x10₇m

8.2.5: ENERGY OF A SATELLITE

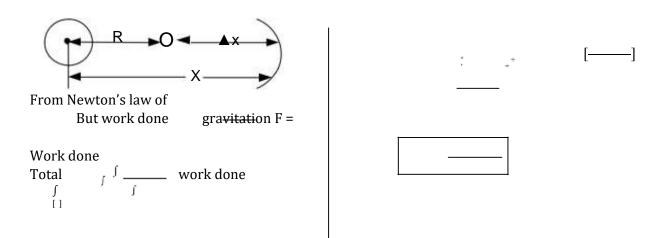

1. Kinetic energy

Consider a satellite of mass m moving in an orbit of radius R around the earth at a constant speed v

2. Potential energy

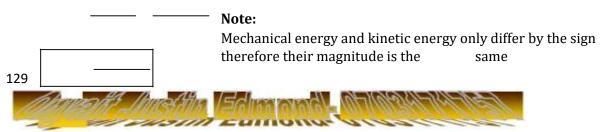

Consider a satellite of mass m brought from infinity into the region of earth's gravitational force.

Definition

Gravitational potential energy P.E is the work done in bringing a unit mass from infinity to that point.

3. Mechanical energy/total energy

If the radius of the orbit of the satellite decreases, the gravitational potential energy of the satellite becomes more negative implying that it has decreased.

Decrease in radius however causes an increase in the kinetic energy, resulting in an increase in the speed of the satellite in its new orbit.

Decrease in orbital radius also results into the mechanical energy becoming more negative hence it has decreased.

8.2.6: EFFECT OF FRICTION ON A SATELLITE

If a satellite is located within the earth atmosphere as it moves in its orbit, the atmospheric gasses offer frictional resistance to its motion. The satellite thus would be expected to do work to overcome this resistance and is so doing, it falls to an orbit of lower radius.

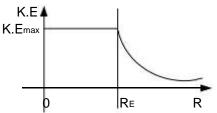

The decrease in the radius causes the total energy (______) to decrease while the kinetic
 energy of the satellite (______) increases resulting into an increase in the speed of the satellite

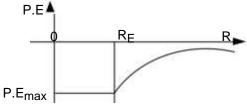

in its new orbit. Because of the increase of the speed the satellite becomes hotter and it may burnout.

Question

Explain why any opposition to the forward motion of a satellite may cause it to burn.

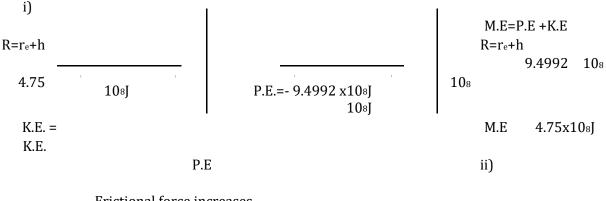

Examples

A satellite of mass 100kg is in a circular orbit at a height 3.59x107m above the earth surface Calculate the kinetic energy, potential energy and the mechanical energy of the satellite in this orbit

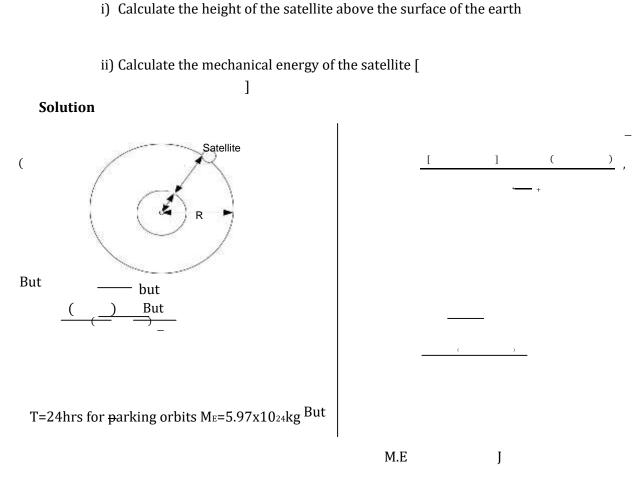

State what happens when the mechanical energy of the satellite is reduced

Solution

Frictional force increases Satellite falls to orbit of small radius PE reduces K.E increases Satellite becomes hot and may burn

A 10₃ kg mass satellite is launched in a parking orbit about the earth

EXERCISE 22

]

ii) Determine the period of the satellite. An[24hrs]

8.2.7: GRAVITATIONAL POTENTIAL [U]

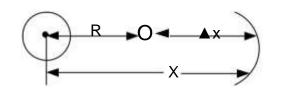

Gravitational potential at a point in the gravitational field is defined as the work done to move a one

fcelstooks

131

kilogram mass (1kg) from infinity to that part. Ie

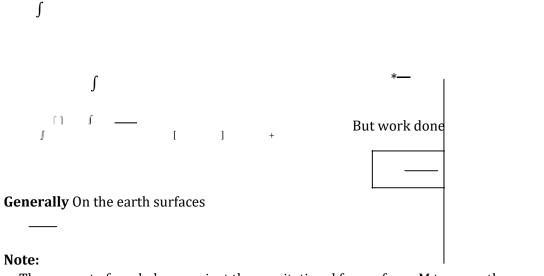

Consider a body of mass 1kg moved from infinity to appoint 0 where the distance from the centre of the earth to 0 is R

From Newton's law of gravitation F = _____

Work done Total work done

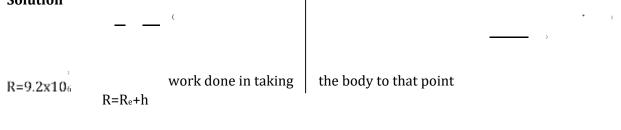

The amount of work done against the gravitational force of mas M to move the mass a distance to position is given by $*--_+$

+

Example

A body of mass 15kg is moved from the earth's surface to a point 2.8×10^{6} m above the earth. If the radius of the earth is 6.4×10^{6} m and its mass is 6.0×10^{24} kg calculate the work done in taking the body to that point

W= 2.85x10₈J

8.2.8: VELOCITY OF ESCAPE

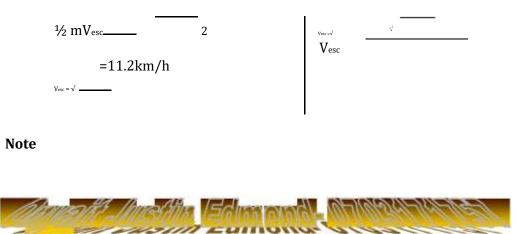

This is the minimum vertical velocity with which a body is projected from the surface of the earth so that it escapes from the earth's gravitational pull.

Derivation of formulae

Suppose a rocket of mass is fired from the earth's surface so that it just escapes from the gravitational influence of the earth

K.E lost = P.E lost

Ecoletooks

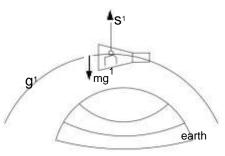

Air molecules at stp have an average speed of about 0.5ms-1 which is much less than the escape velocity and so the earth's gravitational field is able to maintain an atmosphere of air around the earth.

- Light gases like Neon, Argon, helium have mean thermal speed more than 3 time of air. This means that their speeds are higher than the mean speeds of air and this explain why they are rare in the earth atmosphere.
- The moon has no atmosphere because the gravitational field of the moon is not sufficiently strong to prevent gases from escaping.

For other planets escape velocity is given by $\mathsf{Vesc}=\checkmark$

8.2.9: WEIGHTLESSNESS

space craft has a centripetal

An astronaut in an orbiting

acceleration $a=g_1$ where g_1 is the acceleration due to gravity at the height of the orbit.

If S_1 is the reaction of the surface of the space craft in contact with the astronaut then;

 $F=mg_1-S_1$

orbit

132

```
ma= mg_1-S_1
but a=g_1
mg_1= mg_1-S_1
S_1=0
```

The astronaut therefore has no acceleration relative to his space craft and hence experiences zero reaction i.e. **weightless**.

Definition

Weightlessness is the condition of a body having zero reaction when a body moves with the acceleration as acceleration due to the gravity.

CHAPTER 9: SIMPLE HARMONIC MOTION (S.H.M) Definition

This is the periodic motion of a body whose acceleration is directly proportional to the displacement from a fixed point (equilibrium position) and is directed towards the fixed point.

The negative signs means the acceleration and the displacement are always in opposite direction.

9.1.0: Characteristics of SHM

It's a periodic motion (to and fro motion)

Mechanical energy is always conserved

The acceleration is directed towards a fixed point

Acceleration is directly proportional to its displacement

В

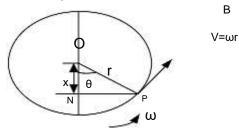

9.1.1: PRACTICAL EXAMPLES OF S.H.M

Pendulum clocks

Pistons in a petrol engine

Strings in music instruments

9.1.3: EQUATIONS OF S.H.M

Balance wheels of a watch

Motor vehicle suspension springs

Consider a particle, p of mass, m, moving round a circle of radius ,r, with uniform angular velocity, . Let the particle be at point p, t seconds after starting motion from A such that the angle subtended at the centre is $,\theta$

a) Displacement x

This is the distance of N from O measured away from O

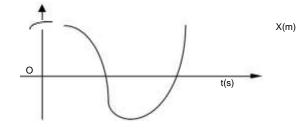

The displacement is obtained from triangle ONP

When the displacement is maximum i.e. when N is at A or at B, then this displacement is known as **amplitude**.

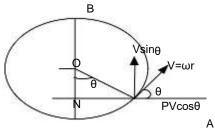

Definition

Amplitude is the maximum displacement of a body (a particle) from equilibrium position.

A GRAPH OF DISPLACEMENTAGAINST TIME

b) Velocity

Velocity of N as a result of the velocity P moving round circle. This is equal to the vertical component of velocity of p

But and _____(2)

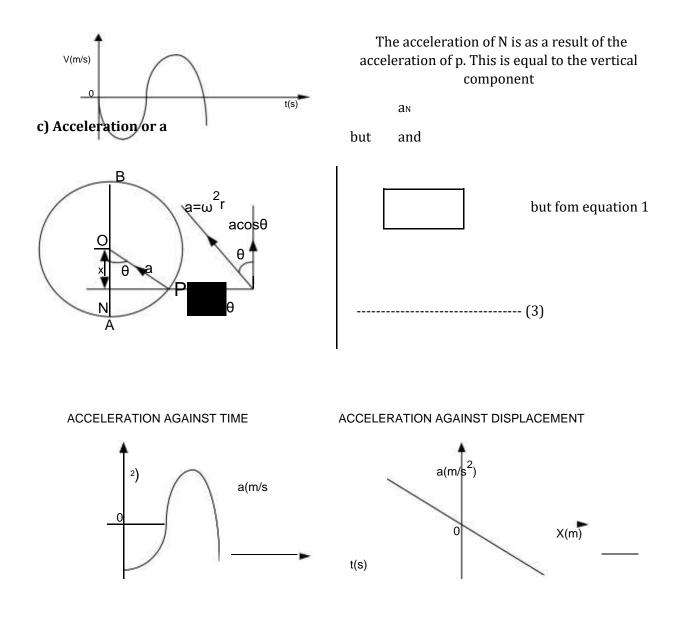

EcoleBooks

Note:

The velocity of N is negative because as p moves from A to B, N moves upwards and when it moves from B to A, N changes direction and moves downwards.

GRAPH OF VELOCITY AGAINST TIME

Identify the forces acting on the body at equilibrium position

Identify the forces acting on the body after displacement from the equilibrium position

Obtain an expression for the restoring force after the displacement and equate this restoring force to [ma] in accordance with Newton's second law of motion.

Compare the expression got with bas(), then motion is simple harmonic. ic standard expression for S.H.M. if it's comparable to

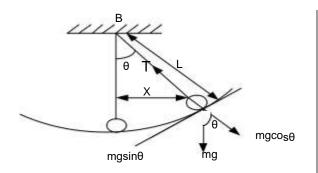

Examples of S.H.M

9.2.1: SIMPLE PENDULUM

Consider a mass m suspended by a light inelastic string of length L from a fixed point B.

At equilibrium the bob lies in a vertical plane with the tension in the string being balanced by the weight of the bob.

If the bob is given a small vertical displacement through an angel θ and released, we show that a bob moves with simple harmonic motion

Resolving tangentially, gives the restoring

force

Restoring force

By Newton's 2nd law

.....2

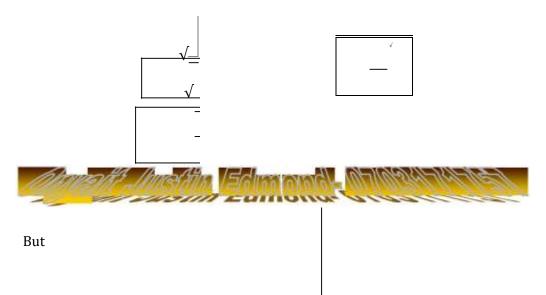

If the displacement is small, then θ is very small such that the arc length is equal to x.

() _it is in the form

and

hence

performs S.H.M with period

9.2.1: Determination of acceleration due to gravity (g) using a simple pendulum

142

EcoleBooks

- Starting with a measured length L of the pendulum, the pendulum is clamped between 2 wood pieces from a retort stand.
- A bob is then given a small angular displacement from the vertical position and released.
- The time t for 20 oscillation is obtained, find period T and hence
- Repeat the procedure for different values of length of the string.
- A graph of T₂ against L is then drawn and its slope S calculated.

Hence acceleration due to gravity is obtained from

Factors which affect the accuracy of g when using a simple pendulum.

- The nature of the string. The string should be inelastic
- Air resistance (dissipative force). In present of air the motion of a simple pendulum is highly damped such that the oscillation dies out quickly that affecting the period.
- The displacement of the bob from the equilibrium position should be small such that the oscillation remain uniform.
- The mass of the bob should be small to minimize the effect of dimension of the object.

In accuracies in the timing and measuring extensions.

Examples ;

A bob of a simple pendulum moves simple harmonically with amplitude 8.0cm and period 2.00s. its mass is 0.50kg, the motion of the bob is un damped. Calculate maximum values of;

a) The speed of the bob, and

b) The kinetic energy of the bob.

Solution

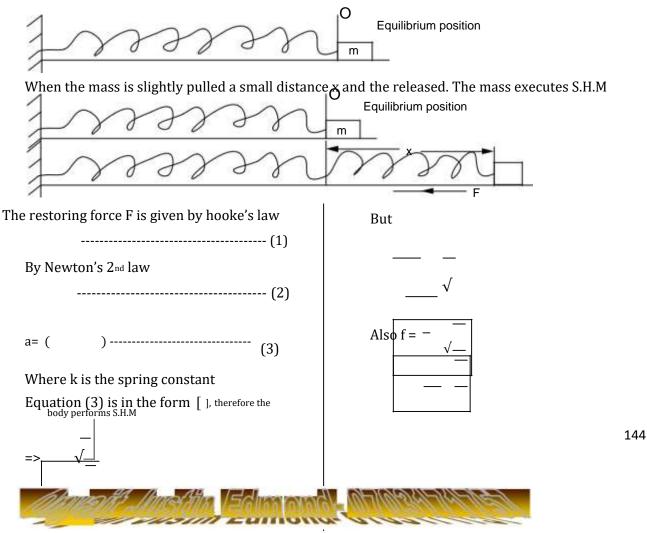

a) m=0.5kg , r=8cm=0.08m, T=2s

MASS ON A SRING

A horizontal spring attached to a mass

9.3.0: ENERGY CHANGES IN S.H.M

In S.H.M there's always an energy exchange. At maximum displacement, all the energy is elastic potential energy while at equilibrium point all the energy is kinetic energy

a) Kinetic energy

It's the energy possessed by a body due to its motion

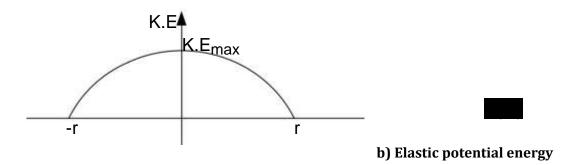

K.E = $\frac{1}{2}$ mv² K.E = $\frac{1}{2}$ m ()

The K.E is zero when the displacement x is equals to the amplitude

K.E is maximum when the displacement x is zero

¹⁄₂ m

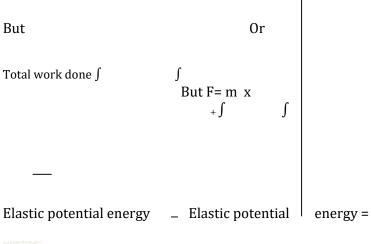

9.3.1: A graph of K.E against displacement

This is the energy possessed by a body due to the nature of its particle i.e. compressed or stretched. 161

Force is applied to make particles stretch or compress and therefore the force does work, which work is stored in the body.

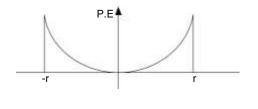

Note .

Elastic potential energy is maximum when x is a maximum

Elastic potential energy is zero when x=0 (equilibrium)

9.3.2: Graph of P.E against displacement

iii) Mechanical energy

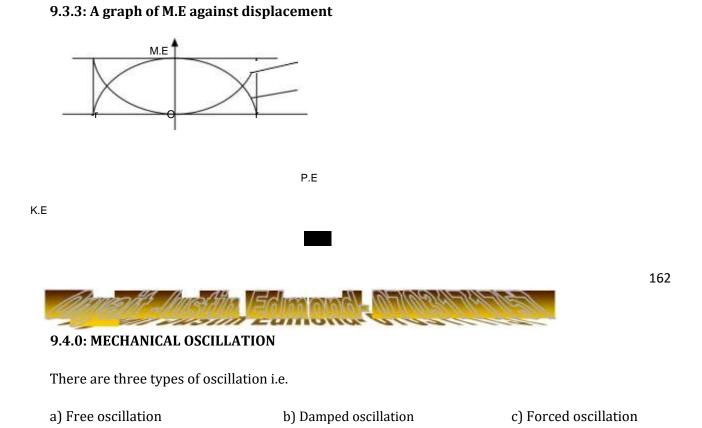

This is the total energy possessed by a body due its motion and nature of its particles

½ m ()

M.E =

Note

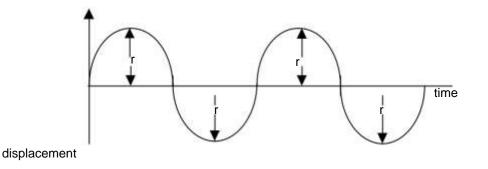

Mechanical energy is constant

a) Free oscillations

These are oscillations in which the amplitude remains constant and oscillating systems does not do work against dissipative force such as air friction, and viscous drag. Eg a pendulum bob in a vacuum

Displacement- time graph

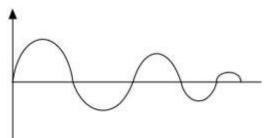

b) Damped oscillations

These are oscillations in which energy is lost and amplitude keeps on decreasing until it dies away due to dissipative forces.

Types of damped oscillations

i) Under damped/slightly damped/lightly damped oscillations

Is when energy is lost and amplitude gradually decreases until oscillation dies away.

displacement

Examples

Mass oscillating at the end of the spring oscillating in air

Simple pendulum oscillating in air

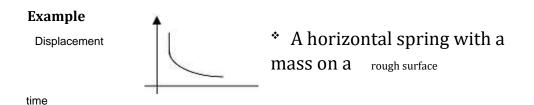

ii)Over damped/highly damped/heavily damped

Is when a system does not oscillate when displaced but takes a very long time to return to equilibrium position.

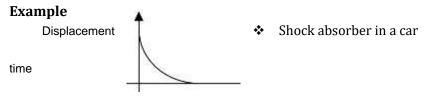

163

EcoleBooks

iii) Critically damped oscillations

Is when a system does not oscillate when displaced and returns to equilibrium position in a short time.

C) FORCED OSCILLATIONS

These are vibrations caused by an external force and the system oscillates at the same frequency as the vibrating force.

Example

Oscillation of a guitar string

Oscillation of a building during an earthquake

Oscillation of air column in a musical pipe

CHAPTER 10: ELASTICITY

If a force is applied to a material in such a way as to deform it (change its shape or size), then the material is said to be stressed and there will be change in relative positions of the molecules within the body and the material become strained. Stress which results in increase in length is called tensile stress and one which results in decrease in length is called compressive stress.

Terms used

Elasticity: This is the ability of the material to regain its original shape and size when the deforming load has been removed.

- **Elastic material:** This is a material which regains its original shape and size when the deforming load has been removed. E.g. Rubber band, spring.
- **Elastic deformation:** This is when a material can recover its original length and shape when the deforming load has been removed.
- **Elastic limit:** This is the maximum load which a material can experience and still regain its original size and shape once the load has been removed.
- **Proportional limit:** This is the maximum load a material can experience for which the extension created on it is directly proportional to the load applied.
- **Hooke's law:** it staes that; the extension of a wire or spring is proportional to the applied load provided the proportional limit is not exceeded.
 - The law shows that when the molecules of a material are slightly displaced from their mean positions, the restoring force is proportional to its displacement.
- I.e. Fα e Where k is the constant of proportionality.
- **Yield point:** this is a point at which there is a marked increase in extension when the stress or load is increased beyond the elastic limit.

The internal structure of the material has changed and the crystal planes have effectively slid across each other. At yield poirt the material begin to show plastic behavior.

Ecoletooks

Few materials exhibit yield point such as mild steel, brass and bronze.

- **Plastic deformation:** this is when a material cannot recover its original shape and size when the deforming load has been removed.
- **Breaking stress/ultimate tensile strength:** it is the maximum stress which can be applied to a material. Or it is the corresponding force per unit area of the narrowest cross section of the wire.

Strength: this is the ability of a material to with stand an applied force before breaking.

Or it is the maximum force which can be applied to a material without it breaking. **Stiffness:** this is the ability of a material to resist changing its shape and size.

Ductility: it is the ability of the material to be permanently stretched. or it is the ability of the material to be stretched appreciably beyond elastic limit. It can be drawn into different shapes without breaking.

Brittleness: it is the ability of the material to break immediately it is stretched beyond to elastic limit.

Toughness: this is the ability of material to resist crack growth e.g. rubber

Tensile stress: it is force acting per unit area of cross-section of a material.

Stress = -

Tensile strain: it is the extension per unit original length of the material.

Strain - =

Strain has no units because it is a ratio of two similar units

Tensile strain

10.1.1: Stress-strain graphs

1. Ductile material e.g. copper, steel, iron

A ductile material is one which can be permanently stretched

Region OA: stress strain, all extensions are recovered when the load is removed. It is Hooke's law region and Young's Modulus can be defined only in this region.

Region AB: Hooke's law is not obeyed but extension is recovered when load is removed.

Region BC; Not all extensions are recovered when the load is removed

Region BC: Changes from elastic to plastic deformation

Point E: without any further increase in stress, the wire begins to under go physical changes, it **thins** out at some point and finally breaks

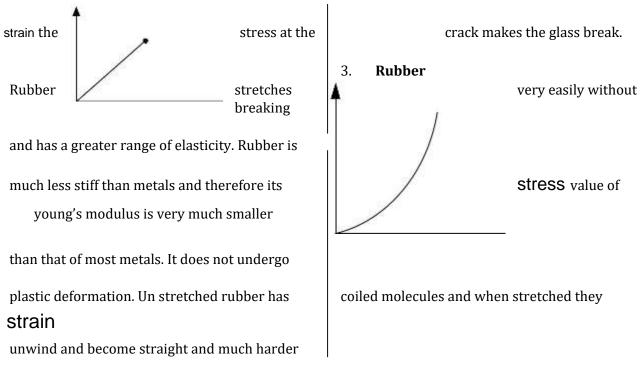

2. Brittle materials e.g. glass, chalk, rocks and cast iron

These are materials that can not be permanently stretched. It breaks as soon as the elastic limit has been reached

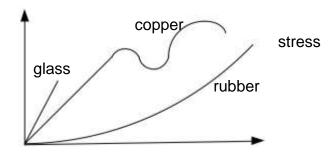

Brittle materials have only a small elastic region

and do not under go plastic deformation. This stress behavior in glass is due to the existence of

cracks in its surface. The high concentration of

10.1.2: Stress-strain graph for glass, copper and rubber

strain

10.1.3: Energy changes/physical process

1. Elastic deformation

Particles are slightly displaced from their equilibrium positions and work done by the force to displace the particles is stored as elastic potential energy. When the stretching force is removed, the potential energy of the particles changes to kinetic energy and moves them back to their equilibrium position.

2. Plastic deformation

It occurs when the material is stretched beyond the yield point. The crystal planes slide over each other and movement of dislocations takes place. When the stress is removed, original shape and size are not recovered due to energy loss in form of heat.

3. Work hardening

It is the process of increasing the resistance of a material to plastic deformation by plastically deforming it repeatedly.

Ecolebooks

During repeated plastic deformation, the metal dislocations move through the material and they entangle round each other and become immobile, it creates the resistance of the material to plastic deformation.

This explains why it is easier to break a copper wire by flexing it to and fro.

4. Annealing

It is a process by which a material restores its ductility.

Procedure

The metal is heated to high temperature above its melting point and maintained in this temperature for a period of time and relaxes the internal strains and hence the metal is re-crystallised and returns to the ductile state.

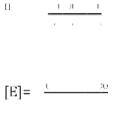

10.2.0: Young's modulus

It is also called the modulus of elasticity of a wire.

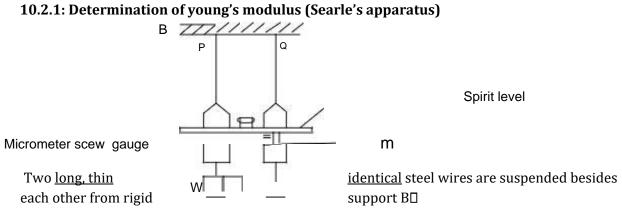

Young's modulus is the ratio of tensile stress to tensile strain of a material

Dimensions of young's modulus

[E]=

The wire P is kept <u>taut</u> and free of <u>kinks</u> by weight A attached to its end□

- The <u>original length</u> of test wire Q is measured and recorded.
- The <u>mean diameter d</u> is determined and cross-sectional area _____ is found.

Known weight, W is added to the free end of test wire Q and the corresponding extension e is read form the vernier scale.□

The procedure is repeated for different weights. however, vernier readings are also taken when the loads are removed. It ensures that the elastic limit is not exceeded.□

A graph of weight W against extension e is plotted and its slope (s) obtained.□

Young's modulus is obtained from

Note

Two identical wires are used to avoid errors due expansion as a result of temperature changes since they are affected equally.

172 Wires are long as it is convenient, because a moderate load would produce a large tensile stress.

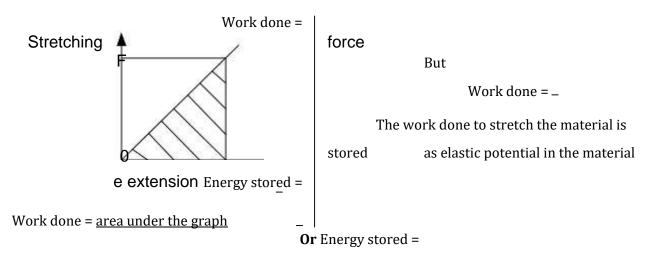

Wires are thin so that a measurable extension is produced even with a small load. Otherwise if the wires were thick it requires a large load which would cause the support to yield.

Micrometer/vernier readings are also taken when the load is removed to ensure that the elastic limit is not exceeded.

10.2.2: Energy stored in a stretched material [strain energy]

Consider a material of an elastic constant k, stretched by a force, to extend by .

By Hooke's law, the extension is directly proportional to the applied force provided the elastic limit is not exceeded.

By calculus [integration]

If F is the force which gives an extension from 0 to e and

(from Hooke's law)

10.2.3: Energy stored per unit volume

Energy stored in the wire =

State the necessary measurements in the determination of young's modulus of a metal wire

(2 marks)

Explain why the following precautions are taken during an experiment to determine young's modulus of a metal wire.

Two long, thin wires of the same material are suspended from a common support (2

marks)

The readings of the Vanier are also taken when the loads are gradually removed

in steps

(1 mark)

CHAPTER 11: FLUID MECHANICS

Both liquids and gases are fluids because they 'flow' i.e. since their molecules are spaced and cause a change in shape without change in volume.

Fluid mechanics involves fluids at rest (hydro statistics) and fluids in motion (hydro dynamics/fluid flow)

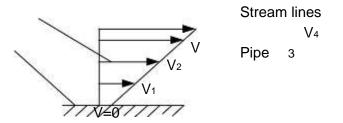

11.1.0: Fluid flow

11.1.1: Viscosity

Definition

Viscosity is the frictional force between adjacent layers of a fluid moving at different velocities. Fluid flow involves a shear. Fluids flow or move in form of layers, adjacent layers of a fluid are displaced over each other to form a shear. The different layers move at different speeds and therefore there will be a frictional force which opposes relative motion between the layers of the fluid. This frictional force is called **viscosity**. The greater the viscosity, the less easily it is for the liquid to flow and the stickier the liquid feels, the harder the liquid to flow.

Fluids stick to the solid surface so that when they flow the velocity must gradually decrease to zero as the wall of the pipe or vessel in approached.

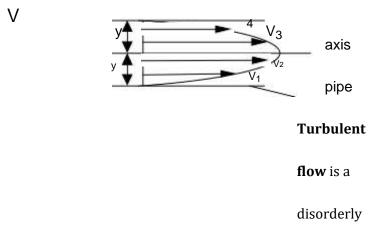

The arrows are known as stream lines and the length of the streamlines represents the magnitude of the velocity.

Definition: A streamline is a curve whose tangent at any point is along the direction of the velocity of the fluid particles at that point.

11.1.2: LAMINAR AND TURBULENT FLOW

Laminar (steady/uniform) flow is the orderly flow of a liquid where lines of flow are parallel to the axis of the tube or pipe and liquid particles at the same distance from the axis have the same velocity.

Laminar flow occurs at low velocities below the critical velocity.

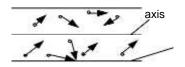

pipe

lines of flow are not parallel to the axis of the pipe and liquid particles at the same distance from the axis have different velocities (speeds and direction).

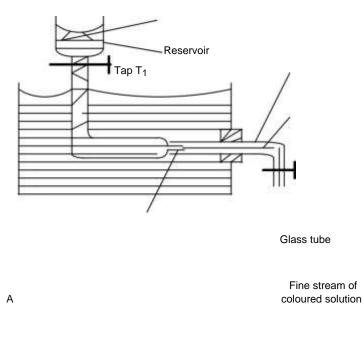

flow where

Turbulent flow occurs at high velocities, above the critical velocity.

11.1.3: EXPERIMENT TO DEMONSTRATE LAMINAR AND TURBULENT FLOW Potassium per maganate solution

DOWNLOAD MORE RESOURCES LIKE THIS ON ECOLEBOOKS.COM

Narrow jet

- The apparatus is set up as above. With taps T₁ and T₂ closed, potassium per magnate solution is poured into the reservoir and water poured into container A
- T₂ is then <u>slightly opened</u> to allow water to flow out of the glass tube and T₁ also opened slightly. A fine stream coloured solution is seen flowing along side the water to the glass tube and this illustrates laminar flow.
- Tap T₂ is then <u>widely opened</u> to allow more water to flow from the glass tube, a stage is reached when the coloured solution in the glass tube begins to spread out and fill the wall of the tube. The critical velocity has been exceeded and turbulence has begun.

| 11.1.4: COEFFICIENT OF | VISCOSITY () |
|-------------------------------|---------------|
| V2 | |
| | x 🖬 🚽 F |
| | |

Consider two parallel layers of a liquid moving with velocities V_1 and V_2 and separated by a distance x with area of contact between the layers A

The slower lower layer exerts a tangential retarding force F on the faster upper layer the lower layer

its self-experiences an equal and opposite tangential force F due to the upper layer.

Velocity gradient is the change in velocity between two layers (points) per unit length of separation

of the points.

Frictional force F between adjacent layers depends on

Area of contact between the layers $[F\,\alpha\,A]$

Velocity gradient between layers [F α velocity gradient]

Therefore

=_____

Definition

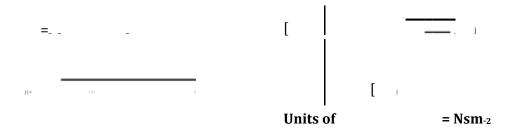

Coefficient of viscosity is the frictional force acting on a unit area of a fluid when it is in a region of unit velocity gradient

OR

Coefficient of viscosity is the <u>tangential stress</u> which one layer of a fluid exerts on another layer in

contact with it when the velocity gradient between the layers is

Dimensions of

11.1.5: Effects of temperature on viscosity

DOWNLOAD MORE RESOURCES LIKE THIS ON ECOLEBOOKS.COM

- In liquids, viscosity is due to <u>intermolecular forces</u> of attraction between layers moving at <u>different speeds</u>. Increase in temperature <u>reduces(weakens) intermolecular</u> forces which <u>increases molecular separation and speed</u>, consequently viscosity in liquids <u>decreases</u> rapidly with <u>increase</u> in temperature
- In gases, viscosity is due to <u>transfer of momentum</u>. Molecules are <u>further apart</u> and have negligible <u>intermolecular forces</u>, molecules move <u>randomly</u> colliding with one another and continuously <u>transferring momentum</u> to the neighboring layers. Increasing the temperature of the gas increases the <u>average speed</u> (increases K.E) of the gas molecules hence increasing the transfer of momentum which results into increase in viscosity of the gas.

Differences between viscosity and solid friction

| Solid friction | Viscosity |
|--|--|
| Independent of area of contact | Depends on area of contact |
| Independent of relative velocity between layers in contact | Directly proportional to velocity gradient |
| Independent of temperature but dependent on normal reaction | Depends on temperature |

11.1.6: Steady flow of a liquid through a pipe (poiseuille's formula)

Poiseuille derived an expression for the volume of a liquid flowing out of a pipe per second. He assumes that the flow was steady/laminar.

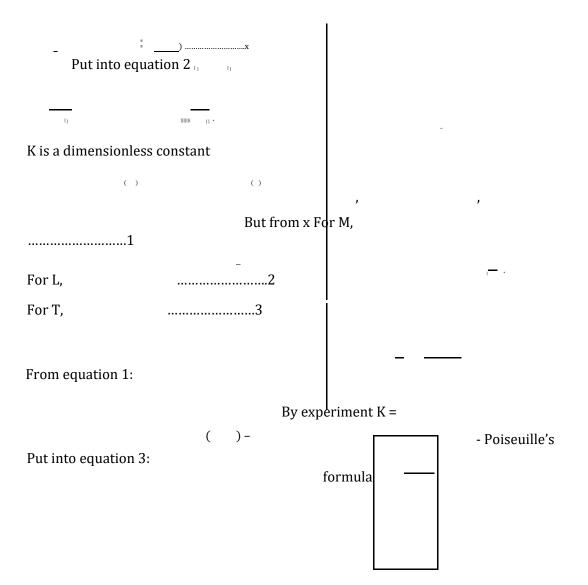

The volume of liquid flowing out of a pipe per unit time (V/t) dependents on; i. The coefficient of viscosity of the liquid

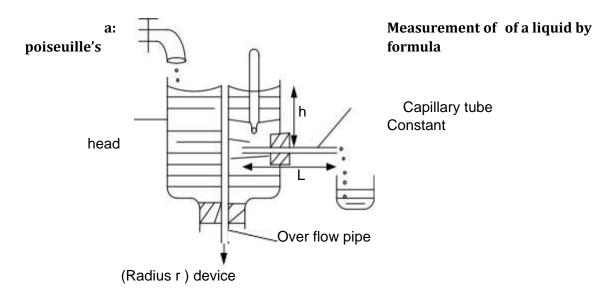

The radius of the pipe r

The pressure gradient P/L causing the flow

(___)

Ecolebooks.com

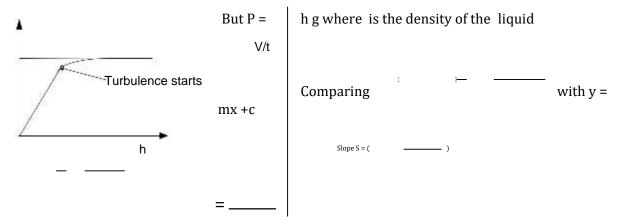

Liquid flowing out

The liquid under test flows steadily through the capillary tube from a <u>constant head device</u> and the volume V of liquid which emerges in a known time t is collected in a beaked and measured.

The <u>r</u>adius r of the tube is measured using a travelling microscope and a meter rule is used to measure its length L and height h of the liquid above the tube.

The procedure is repeated by lowering or raising the overflow pipe to obtain several values of () for each h.

A graph of () against h is plotted and its slope is determined from the straight part of laminar flow.

Note:

The experiment must be carried out at a constant temperature to avoid changes in

EcoleBooks

ु:llary

Great care is needed when measuring r because it appears in the calculation of as r₄.
 This makes the % error in due to an error in r four times the % error in r

A capillary tube is used because r needs to be small so that h is large enough to be measured accurately

4.1

11.2.0: STOKE'S LAW AND TERMINAL VELOCITY

11.2.1: Derivation of Stoke's law

Stoke's suggested that any particle moving through a fluid experiences a retarding force called **viscous drag** due to the viscosity of the fluid. This force depends on the speed of the body V and acts in opposite direction to its motion

Note:

Viscosity of a fluid is the frictional force opposing relative motion between adjacent layers while **viscous drag** is the frictional force experienced by a body moving in a fluid due to its viscosity. The viscous drag F on a spherical body depends

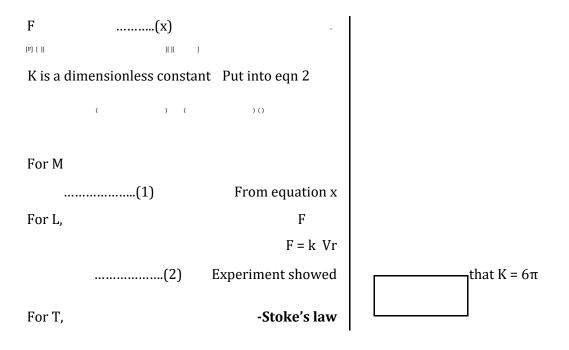

On the radius (r) of the sphere

Velocity V of the sphere

Coefficient of viscosity

F

190

11.2.2: TERMINAL VELOCITY

Consider a sphere of radius, falling from rest through a viscous fluid.

The forces acting on the sphere are its weight downwards , up thrust upwards due to the displaced fluid and the viscous drag, F upwards due to viscosity of the fluid.

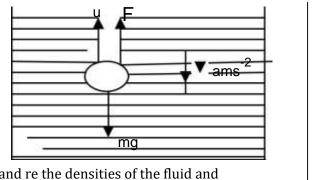

As the body accelerate downwards, its velocity increase and from π r so does the viscous drag increase .When the body is completely immersed in the fluid, up thrust remains constant since

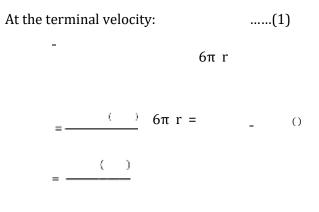

no more fluid is being displaced.

A point is reached when . This implies that the net force acting on the body is zero and body continues to move down with a maximum constant velocity called *terminal velocity*.

11.3.0: Equation of continuity

Consider a fluid undergoing steady flow and consider a section XY of a tube of flow with the fluid. Let A₁ and A₂ be the cross-section areas of the tube of flow at X and Y respectively

- and be the densities of the fluid at X and Y respectively
- $V_1 \mbox{ and } V_2 \mbox{ be the velocities of the fluid particles at X and Y respectively.}$

In a time interval Δt the fluid at X will move forward a distance V₁ Δt . therefore, a volume A₁V₁ Δt will enter the tube at X. the mass of fluid entering at X in time Δt will be there be

 $\rho_1 A_1 V_1 \Delta t$

Similarly the mass leaving at Y in the same time is $\rho_2 \; A_2 V_2 \Delta t$

Since the mass entering at X is equal to mass leaving at Y $\rho_1A_1V_1\Delta t$ = $\rho_2~A_2V_2\Delta t$

For an incompressible fluid $\rho_1 = \rho_2$

_____1

Equation 1 is an equation of continuity for an incompressible fluid

Definition

An incompressible fluid is a fluid in which changes in pressure produce no change in the density of the fluid

11.3.1: WHY LIQUIDS FLOW FASTER IN CONSTRICTIONS

Volume flow per second is constant, so by the equation of continuity: $A_1V_1 = A_2V_2$

 $_$ It implies that A₂ α _ if then

Hence the velocity at the wider part is less than that at the constructed part

11.3.2: Bernoulli's equation

It states that for an incompressible non viscous fluid undergoing steady flow, the pressure plus the potential energy per unit volume plus kinetic energy per unit volume is constant at all points on a stream line.

i.e.

P is the pressure with in the fluidg is the acceleration due to gravity ρ is thedensity of the fluidh is height of the fluid (above reference line) v is thevelocity of the fluid

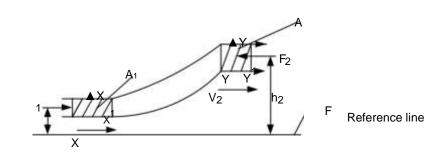

11.3.3: Derivation of Bernoulli's equation

Consider a tube of flow with in a non-viscous incompressible fluid undergoing steady flow Let ρ_1 and ρ_2 = pressure at X and Y

 V_1 and V_2 = velocities at X and Y

 $A_1 \text{ and } A_2 = \text{area of cross section at X and Y} \\ h_1 \text{ and } h_2 = \text{Average heights at X and Y}$

2

h1 V1

Let X₁ be close to X so that each of the parameters above has the same value at X₁ and at X. Let Y₁ be close to Y with similar consequences

Since the fluid is incompressible, the density will be the same at all points. Let this be ρ .

Consider the section of fluid which is between X and Y moving to occupy the region between X₁ and Y₁. The fluid moves in this direction because the force F₁ is greater than the force F₂. The force F moves a distance and the fluid moves a distance against the force F₂ Network done on the fluid is therefore given by

.....1

Since the fluid is undergoing ste4ady flow, the mass of fluid that was originally between X and X₁ is equal to the mass which is now between Y and Y₁. Let this mass be M, thus a mass M which originally had velocityV₁ and average height H₁ has been replaced by an equal mass with velocity V₂ and average height h₂, therefore,

| Gain in kinetic energy | - | 2 |
|--------------------------|---|-------|
| Gain in potential energy | | 3 |

Name of the work done on the fluid has been used to overcome internal friction since the fluid is non-viscous and therefore by the principle of conservation of energy. Work done= Gain in kinetic energy + Gain in potential energy

Work done

F₁ **-F**₂

 $A_1V_1\Delta t - A_2V_2\Delta t$

But A_1 (volume between X and X_1) = ____

And similarly volume between Y and $Y_1 (A_2) = -$

_ _

aconstant

Assumptions

The flow is laminar

The fluid is incompressible and non viscous

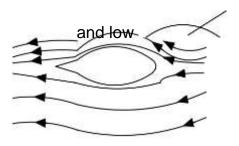

The pressure and velocity are uniform at any cross section of the tube

Note

In accordance with equation of continuity, fluids speed up at constrictions and therefore there is a decrease in pressure at constrictions. This effect is made use of in such devices are filter pumps, Bunsen burners and carburetors

11.3.4: Application of Bernoulli's principle

It follows from Bernoulli's equation that whenever a flowing fluid speeds up, there is a corresponding decrease in the pressure and for the potential energy of the fluids. If the flow is horizontal, the whole of the velocity increase is accounted for by a decrease in pressure.

1. Aero foil lift Region of high speed pressure

Region of load and high pressure

wings than below the wings.

An aero foil e.g. an air craft wing is shaped so that air flows faster along the top of the

By Bernoulli's principle pressure below becomes greater than that above the wings.

This pressure difference produces the resultant force called lift upwards force. It is this force which provides a force that lifts the plane off the ground at take off

2. A spinning ball

A ball such as a football, tennis or golf and therefore high air speed ball low pressure that is projected to travel through air experiences a sideways force which makes it Direction of ball Spin curve in flight. This is because the spin drags air around with the ball such that air moves low air speed and therefore high pressure force which makes the ball the curve as it

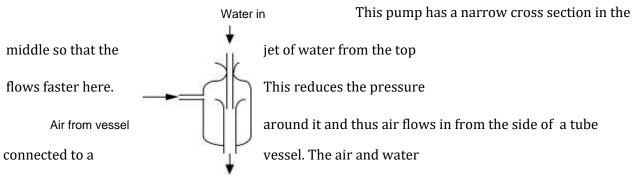

spins.

faster on one side of the ball than the other. The pressure difference causes a resultant

3. Sanction effect

This is experienced by a person standing close to the platform at the station when a fast moving train passes. The fast moving air between the person and the train produces a decrease in pressure and the excess pressure on the other side pushes the person towards the train

4. Filter pump

are expelled together through the bottom of

To the drain the pump

5. Bunsen burner

The gas passes the narrow jet at high speed creating a low pressure region. Atmospheric pressure then pushes air in through the hole and the mixture flows up the tube to burn at the top

Carburetor

The air passage through a carburetor is partially constructed at the point where petrol and air are mixed. This increases the speed of air but lowers its pressure and permits more rapid evaporation of the petrol.

Examples

Water flows along a horizontal pipe of cross section area 30cm₂. The speed of water is 4ms₋₁ but this rises to 7.5m/s in constriction pipe. What is the area of this narrow part of the tube.

From the equation of continuity $A_1V_1 = A_2V_2 \, Area \ of \ the \ narrow \ part \ is \ 16c$

Water leaves the jet of a horizontal horse at 10m/s. If the velocity of the water with in the horse is 0.4m/s. Calculate the pressure P with in the horse (density of water 1000kgm-3) and atmospheric pressure 105Nm-2

Solution

$$V_1 = 0.4 \text{m/s}, P_1 = ?, 1000 \text{kg/m}_3,$$

 $V_2 = 10 \text{m/s}, P = 10^5$ $P_1 + \frac{1}{2}\rho$
 $P_1 + \frac{1}{2}x1000x$
 $P_1 + \frac{1}{2}x1000x$
 $P_2 = + \frac{1}{2}x1000$
 $P_2 = + \frac{1}{2}x1000$
 $P_2 = + \frac{1}{2}x1000$
 $P_2 = - \frac{1}{2}\rho v_2 + \frac{1}{2}\rho v_$

A fluid of density 1000 flows in a horizontal tube. If the pressure the entry of the tube is and at the exit is , given that the velocity of the fluid at the entry is , calculate the velocity of the liquid at the exit.

Solution P + $\frac{1}{2} \rho v_2$ + = a constant

 $P_1+\frac{1}{2}\rho$ $^2=P_2+\frac{1}{2}\rho$ $_2$ for horizontal flow

4. An air craft design requires a dynamic lift of on each square meter of the wing when the speed of the air craft through the air is 80 . Assuming that the air flows past the wing with streamline line flow and that the flow past the lower surface is equal to the speed of the air craft, what is required speed of the air over the upper surface of the wing if the density of the air is

11.3.5: Measurement of fluid velocity

5. Venture meter

This is a device which introduces a constriction into a pipe carrying a fluid in order that the velocity of the fluid can be measured by measuring the resulting drop in pressure.

Consider the fluid to be non viscous, incompressible and of density ρ in a horizontal steady flow let the pressure and velocity be P_1 and V_1 at the main pipe and P_2 and V_2 at the constricted pipe along the same stream line

Applying Bernoulli's equation

 $P_1 + \frac{1}{2} \rho_2 = P_2 + \frac{1}{2} \rho_2$ (1) (horizontal flow)

If the cross sectional areas at main and constructed equation of continuity.

 $A_1V_1 = A_2V_2$

= _____

Put into equation 1 _____ $P_1 + \frac{1}{2}\rho$ $^{2}=P_2 + \frac{1}{2}\rho()$ *(* +

Thus by measuring pressures and and knowing ρ , A₁, and A₂ it is possible to find the velocity of V₁ of the fluid in the un constricted (main) section of the pipe.

Note: P_1 h₁g and P₂ h₂g

Examples 1.a)

Ecolebooks

3. Pitot-static tubes

30x

The Pitot - static tube is a device used to measure the velocity of a moving fluid. It consists of two manometer tubes, the pitot tube and the static tube. The pitot tube has its opening facing the fluid flow, the static tube has its opening at right angles to this

The total pressure exerted by a flowing liquid has two components ie the static pressure and dynamic pressure. Static tube measures the static pressure while pitot tube measures total pressure.

 $P + \frac{1}{2}\rho v_2 + = a \text{ constant}$

Static pressure= P + and Dynamic pressure = _

D –

Static pressure

Static pressure at a point is the pressure that the fluid would have if it were at rest.

Dynamic pressure

It is the pressure of a fluid due to its velocity

Total pressure

It is the sum of the dynamic and static pressure.

Example

The static pressure in a horizontal pipe line is $4.3x10_4$ Pa, the total pressure is $4.7x10_4$ Pa and the area of cross-section is 20cm₂. The fluid may be considered to be incompressible and non viscous and has a density of 10kgm-₃. Calculate

The flow velocity in the pipeline

The volume flow rate in the pipeline

2. Water flows steadily along a uniform flow tube of cross-sectional area 30 . The static pressure is and the total pressure is . assuming that the density of water is

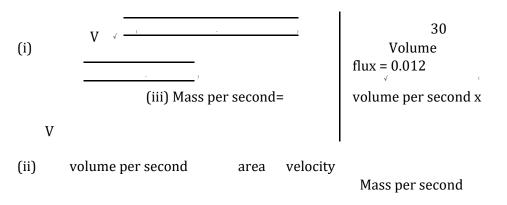

1000 , calculate the;

Flow velocity

Volume flux

Mass of water passing through a section of the tube per second

Solution

A pitot – static tube fitted with a pressure gauge is used to measure the speed of a boat at sea. Given that the speed of the boat does not exceed 10m/s and the density of sea water is 1050kgm-₃,

calculate the maximum pressure on the gauge

Solution

Maximum pressure is the dynamic pressure =

Dynamic pressure = Dynamic pressure

5.25x104Pa

Exercise: 28

Water flows speedily along a horizontal tube of cross-sectional area 25cm₂. The static pressure with in the pipe is 1.3x10₅pa and the total pressure 1.4x10₅pa. Calculate the velocity of the water flow and the mass of the water flow past a point in a tube per second. [**an 4.47m/s, 11.175kg/s**]

A lawn sprinkler has 20 holes each of cross sectional area 2x10-2cm2 and its connected to a horse pipe of cross sectional area 2.4cm2, if the speed of the water in the horse pipe is 1.5m/s, estimate the speed of the water as it emerges from the holes. **[an9m/s]**

Water flows speedily along a uniform flow tube of cross section 30cm₂. The static pressure is 1.2x10₅Pa and the total pressure is 1.28x10₅Pa. Calculate the flow velocity and the mass of water

per second flowing past a section of the tube. (Density of water is 1000kg .)[an 4m/s, 12kg/s]

Air flows over the upper surface of the wings of an aero plane at a speed of 120ms-1 and past the lower surfaces of the wings at 110ms-1. Calculate the lift force on the aero plane if it has a total wing

area of 20m₂. (density of air) [an= 2.97x10₄N]

11.4.0: FLUIDS AT REST

11.4.1: DENSITY AND RELATIVE DENSITY

Density of a substance is defined as the mass per unit volume of a substance.

S.I uniť s

Relative density

Definition

It is the ratio of the density of a substance to density of an equal volume of water at 4_0c It is at 4 because water has maximum density of $1000kgm_{-3}$ at that temperature

1,_____

It can also be defined as the ratio of the mass of a substance to mass of an equal volume of water

- for W = mg R.D = -

It can also be defined as the ratio of weight of a substance to weight of an equal volume of water. **Note:** Relative density has no units.

11.4.2: ARCHIMEDE'S PRINCIPLE

It states that when a body is wholly or partially immersed in a fluid, it experiences an up thrust equals to the weight of the fluid displaced.

I.e. Up thrust = weight of fluid = apparent loss of weight of the object in a fluid.

Definition

Up thrust is the apparent loss of weight of an object immersed in a fluid

0r

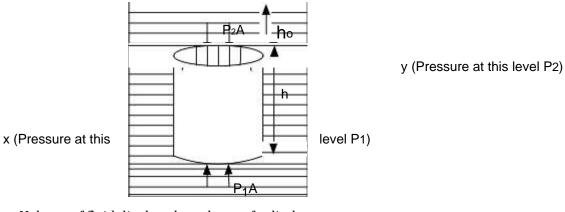

feelstooks

It is the resultant upward force on the body due to the fluid.

11.4.3: Verification of Archimedes' principle using a cylindrical rod

Consider a cylindrical rod of cross-sectional area A and height h immersed in a large quantity of a fluid of density such that its top is at level Y, meters below the surface of the fluid while its bottom is at level X shown below

Volume of fluid displaced = volume of cylinder

Ah

Mass of fluid displaced = Ah

The fluid exerts forces of ${}_{1}A$ and ${}_{2}A$ on the bottom and top faces of the cylinder.

The up thrust (resultant upward force due to the fluid is therefore given by

=2A 1 (h ho) ho Ah g.....(ii)

From equation (i) and equation (ii), therefore; weight of fluid displaced

207

Question: Show that the weight of fluid displaced by an object is equal to up thrust on the object

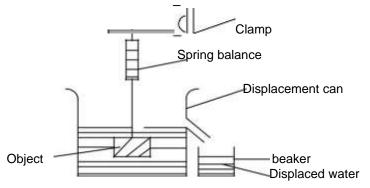

11.4.4: Verification of Archimedes' principle using a spring balance.

Fill the displacement can with water till water flows through the spout and wait until the water stops dripping. Weigh a solid object in air using a spring balance and record its weight

Place a beaker of known weight beneath the spout of the can.

208 With the help of the spring balance, the solid object is carefully lowered into the water in displacement can and wait until water stops dripping when it is completely immersed, its

weight (apparent weight) is then read and recorded from the spring balance as . > Re weigh the beaker and the displaced water and record the weight as

Results

Let the weight of the empty beaker be

Weight of water displaced = weight of (beaker +water) – weight of beaker Weight of water displaced = ______1

Apparent loss of weight of object = weight of object in air – weight of object in water

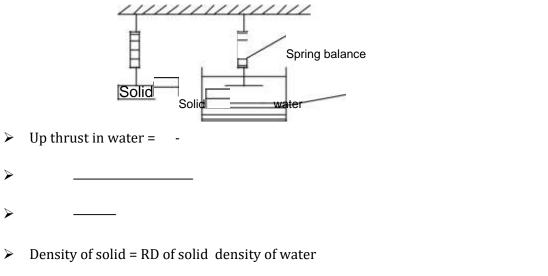

Apparent loss of weight of the object = -If (-)=((), then Archimedes's principle is verified

11.4.5: Application of Archimedes' principle

It can be used to determine density and relative density of a solid and a liquid.

Determination of density and relative density of a solid

- > Weigh the solid in air and its weight () recorded using a spring balance.
- Immerse the solid wholly in water and record its apparent weight from balance ()

Example

An object suspended from the spring balance is found to have a weight of 4.92N in air and 3.87N when immersed in water. Calculate the density of the material from which the object is made of the density of water is 1000kgm-3

Solution

= 4.92, = 3.87N

water

RD = 4.686 _____ Density of substance = RD x of = 4.686 x 1000 = 4686kgm.3

Exercise : 29

A piece of glass weighs 0.5N in air and 0.30N in water. Find the density of the glass.

11.5.0: FLOATATION

A body floats in a liquid if its density is less than the density of the liquid.

11.5.1: Law of floatation

It states that a floating body displaces its own weight in the fluid in which its floating.

Experiment to verify the law of floatation

(Same as verification of Archimedes' principle)

Note:

For a floating body

The weight of floating body =weight of fluid displaced

The weight of fluid =Up thrust

The weight of floating body = Up thrust

The mass of the floating body = the mass of the fluid displaced

A floating body sinks deeper in liquids of less density than in liquids of higher densities.

Density of a floating body = fraction submersed x density of liquid

Volume of displaced liquid = fraction submerged x volume of floating body.

Example

A solid weighs 237.5g in air and 12.5g when totally immersed in a fluid of density 0.9g/cm₃. Calculate

Density of the solid.

The density of the liquid in which the solid would float with 1/5 of its volume exposed above the liquid surface.

Solution

CHAPTER 12: SURFACE TENSION

The surface of a liquid behaves like an elastic skin in a state of tension.

It is responsible for the following observations;

- 1- A needle floating on an undisturbed water surface though made of material which is denser than water
- 2- Some insects walk on water surface without sinking
- 3- Drops of water remaining suspended and becoming nearly spherical when falling from a tap
- 4- Mercury gathering into small droplets when spilt

12.1.0: Molecular explanation for existence of surface tension

Liquid molecules attract each other. In the bulk of the liquid the resultant force on any molecule such as A is zero.□

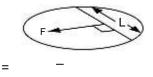

A surface molecule such as B is subjected to intermolecular forces of attraction below therefore potential energy of surface molecules exceeds that of the interior. Average separation of the surface molecules is greater than that of molecules in the interior. At any point on a liquid

ficeletooks

surface there is a net force away from that point and this makes the surface behave like an elastic skin in a state of tension. This accounts for surface tension.□

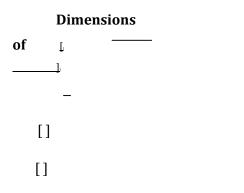

Definition

Surface tension coefficient of a liquid is defined as the force per unit length acting in the surface and perpendicular to one side of an imaging line drawn in the surface.

Units of

are Nm-1

Other units of are kgs-2 12.1.2: Factors affecting surface tension

Temperature

When the temperature of a liquid is increased, the liquid molecules gain kinetic energy and the molecules become more free to move and rush to the surface. The number of molecules in the surface increase, potential energy of the surface molecules is lowered and the separation of molecules decreases leading to a reduction in the intermolecular attraction, this reduces tension energy of molecules and hence surface energy tension is also reduced.

Impurities

Impurities detergents and soap get between the molecules of the liquid reducing the intermolecular forces between the liquids and hence reducing surface tension

Nature of the liquid

Different liquids have different surface tension

12.1.3: SHAPES OF LIQUID SURFACE

The surface of a liquid must be at right angles to the resultant force acting on it otherwise there would be component of this force parallel to the surface which would cause motion.

Normally a liquid surface is horizontal i.e. at right angles with the force of gravity but where it's in contact with the solid it's usually curved.

The particular form that this curvature takes is determined by the strengths of what are called the **cohesive** and **adhesive** forces.

Definition

Cohesive force is the attractive force exerted on a liquid molecules by the neighboring liquid molecules.

Adhesive forces is the attractive force exerted on a liquid molecule by the molecules in the surface of the solid.

Consider a liquid in a container with vertical sides

If the adhesive force is large comparative with the cohesive force, the liquid tends to stick to the wall and so has a concave meniscus (curves upwards).

Solid surface If the cohesive pulls away from fiquid fi

e.g water and glass

force is large compared with adhesive , the liquid surface the

wall and the meniscus is convex(curves downwards)

| e.g | | mercury and glass |
|-------|--------|-------------------|
| Solid | liquid | surface |

12.14: ANGLE OF CONTACT θ

This is the angle between the solid surface and the tangent plane to the liquid surface at the point where it touches the solid measured through the liquid.

From the diagrams above, the meniscus is concave when θ is less than 90₀ and is convex when θ is greater than 90₀.

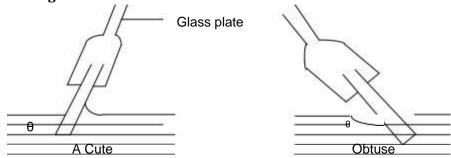

A liquid is said to wet a surface with which its angle of contact is less than 90.

The angle of contact of water and clean glass is **zero**, and that between mercury and clean glass is

. Thus water wets clean glass, mercury does not.

Addition of a detergent to a liquid lowers its surface tension and reduces the contact angle.

Measurement of angle of contact

A clean glass plate is placed at varying angles to a liquid until the surface on one side of the plate remains horizontal. The angle θ made between the horizontal surface and the plate is the angle of contact.

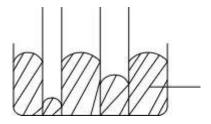

12.3.0: CAPILLARITY

When a capillary tube is immersed in water and the plane vertical with one end of water. Water rises to a height above the surface of water in the container. This is due to the fact that adhesive forces are greater than the cohesive forces.

| The narrower the tube, water rises. | the greater is the height to which |
|--|------------------------------------|
| | Water |

DOWNLOAD MORE RESOURCES LIKE THIS ON ECOLEBOOKS.COM

If the capillary tube is dipped inside mercury liquid is depressed below the outside level. This is because the cohesion of mercury is greater than the adhesion of mercury and glass. The depression of the tube increases with decreases the diameter of the tube

Mercury

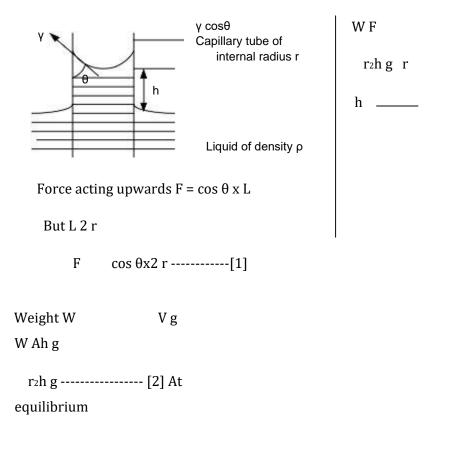

Definition

Capillarity: Is the rise or fall of a liquid in a capillary tube

12.3.1: Capillary rise

Around the boundary where the liquid surface meets the tube, surface tension forces exert a downward pull on the tube since they not balanced by any other surface tension forces.

The tube therefore exerts an equal but upwards force on the liquid which forces it to rise. The liquid stops rising when the weight of the raised column acting downwards equals to vertical component of the upward force exerted by the tube in the liquid. Weight = vertical component of surface tension

12.3.2: Capillary depression

Consider mercury inside a tube and the angle of contact $\boldsymbol{\theta}$

| Equating | | | |
|----------|----------------|--|-----|
| But P1 | H(atmospheric) | | |
| h g | | | |
| _ | | | [1] |
| Also: P2 | [2] | | |

Example

A clean glass capillary tube of internal diameter 0.04cm is held with its lower end dipped in water contained in a beaker and with 12cm of the tube above the surface of water.

To what height will water rise in the tube.

What will happen if the tube is now depressed until only 4cm of its length is above the surface.

(of water =7.0x10-2Nm-1, of water =1000kgm-3)

Solution

i) Using h = _____

But for a clean glass of water $\theta = 0$

h _____ . .

0.071m

If only 4cm of the tube is left above the water surface, this length is less than h in part (i) above so water must change its angle of contact so that it can fit the 4cm

h ______.

 $\theta = 55.9_{0}$

water forms a new surface with an angle of contact $56{\scriptstyle 0}$

A U-tube is made with an internal diameter of one arm 2.0cm and the other 4mm and mercury is poured in the two tubes. If the angle of contact of mercury with glass after exposure to air is 160°. What will be the difference in level of surface in the tubes, take surface tension of mercury as 0.0472Nm-1

229

Solution
$$r_1=2x10^{-3}m r_2=1x10^{-2}m$$
13600kgm-3(density of mercury) $=0.0472 \ \theta=180 \cdot 160_0$ $\theta=20_0$ (we subtracted to obtain a positive value of the)Note: we only subtract for angles greater than 90_0 h_1 $3.32x10_4m$ Difference =h_1- h_2 h_2 $-- h_1$ $3.32x10_4m$ Difference =h_1- h_2

Exercise: 32

1. A liquid of density 1000kg and surface tension , dipped in it is a capillary tube with a bore radius of 0.5mm. If the angle of contact is 00 determine, the height of the column of the liquid rise

if the tube is pushed until its 2cm above the level of the liquid, explain in what happen **An[2.96x10**-2**m**, **47.5**₀]

The two vertical arms of manometer containing water, have different internal radii of 10_{-3} m and $2x10_{-3}$ m respectively. Determine the difference in height of the two liquids levels when the

arms are open to the atmosphere. (surface tension and density of water are 1 and 10₃kgm-3 respectively) **An[7.14x10**-3**m**]

The end of a clean glass capillary tube having internal diameter 0.6mm is dipped into a beaker containing water, which rises up the tube to a vertical height of 5.0cm above the water surface in the

beaker. Calculate the surface tension of water (Density of water =1000kg , g=10ms-2). What would be the difference if the tube were not perfectly clean so that the water did not wet it, but had an angle of contact of 30° with the tube surface. An[7.5x10Nm-1, the water would rise to only 4.3cm]

4. A capillary tube which is clean is immersed in water of surface tension and water rises
6.2cm in the capillary tube. What will be the difference in the mercury level, if the same capillary tube is immersed in the mercury (surface tension of mercury = 0.84 N , angle of contact between mercury and glass =140₀, of mercury = , of water =1 kg 3)

An[h=4.2cm]

Mercury is poured into glass U-tube with vertical limbs of diameters 2.0mm and 12.0mm respectively. If the angle of contact between mercury and the glass is 140 and the surface tension of mercury is 0.52N , calculate the difference in the levels of mercury. (density of mercury is

) An()

6. A U-tube with limbs of diameter 7mm and 4mmm contains water of surface tension , angle of contact and density 1000kg . Find the difference in the levels.

A glass U-tube is such that the diameter of one limb 4.0mm while that of the other is 8.0mm. the tube is inverted vertically with the open ends below the surface of water in a beaker. Given that

surface tension of water is , angle of contact between water and glass is zero, and that density of water is 1000kg. What is the difference between the heights to which water rises in the two limbs.

Calculate the height to which the liquid rises in the capillary tube of diameter 0.4mm placed vertically inside

(i) A liquid of density

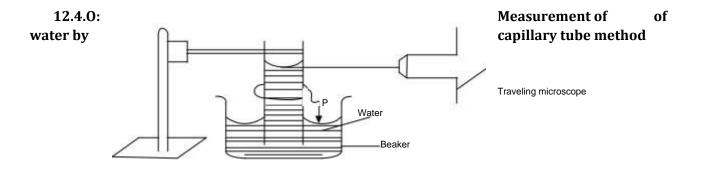

and surface tension

and angle of

contact 3

Mercury of angle of contact 139 and surface tension 0.52N

An[0.032m, 0.0294m]

- A clean capillary tube is dipped in water as shown and a wire p which is bent is tied along the capillary tube with a rubber band.
- When the tube is dipped into water, the wire p is adjusted so that its top just touches the surface of the water.
- A travelling microscope is focused on the water meniscus in the capillary tube and the reading noted, say h₁.

The beaker is then removes and the travelling microscope is focused on the tip of the wire p and scale reading h_2 is noted.

The height of the water rise $h=/h_1-h_2/$.

The capillary tube is removed and its diameter and hence radius , r is determined by using a travelling microscope. The surface tension can be obtained from ;

h=_____

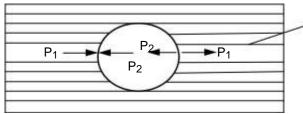

for clean glass ---- of water $\theta = 0_0$

12.2.0: PRESSURE DIFFERENCE ACROSS A SPHERICAL INTERFACE

The pressure inside a soap bubble is greater than the pressure of the air outside the bubble. If this were not so, the combined effect of the external pressure and the surface tension forces in the soap film would cause the bubble to collapse, similarly the pressure inside an air bubble in a liquid exceeds the pressure in the liquid and the pressure inside a mercury drop is greater than that outside it.

12.2.1: Pressure difference across an air bubble

Consider an air bubble of radius r which is spherical and formed in a liquid of surface tension

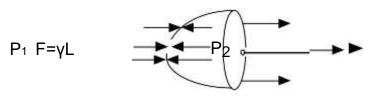

Liquid

pressure on the bulb due to

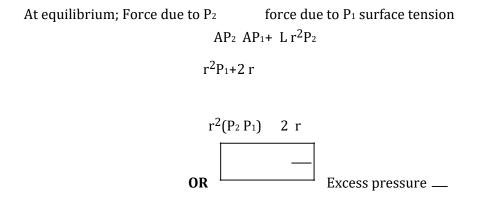

P₁ = External the liquid

 P_2 = internal pressure of air in the bubble

Considering half of the bubble. The remaining half experiences surface tension force due to the other half and this force acts towards the right.

For the bubble to maintain its shape the, internal pressure should be bigger than the external pressure.

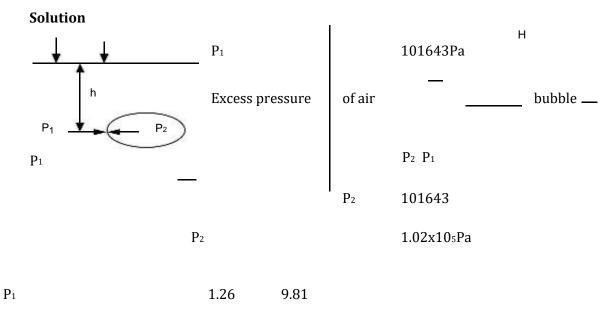

Note:

The pressure inside an air bubble is greater than that outside, otherwise the combined effect of the external pressure and the surface tension forces in the air bubble to collapse. The same case can be extended to a soap bubble.

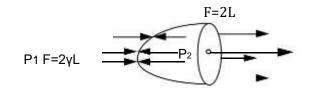

Example

Calculate the pressure inside a spherical air bubble of diameter 0.1cm blown at depth of 20cm below the surface of a liquid of density 1.26 and surface tension 0.064N .(height of mercury barometer is 0.76m, and density of mercury is).

12.2.2: Excess pressure (pressure difference) for a soap bubble

For a soap bubble of radius r, there are two surfaces of liquid in contact with air (the air inside the bubble and air outside the bubble). Therefore the total length of surface in contact with air is 2L such that surface tension force.

 AP_2

| P 2 P1 | _ | | | | | P_2 | 1.0006x105Pa |

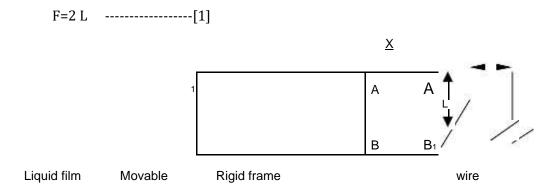

12.1.1: FREE SURFACE ENERGY ($^{\sigma}$)

It is defined as the work done in creating a unit area of a new surface under isothermal conditions . Units of σ are Jm-2 or Nm-1

Consider stretching a thin film of a liquid on a horizontal frame as shown below. Since the film has both an upper and lower surface, the force F on AB due to surface tension is given by

Ecolebooks.com

Ecoletooka

If AB is moved a distance x to $A_1B_1,$ then work has to be done against this force

Work done = force x distance

-----[2]

The increases in surface area is 2LX (upper and lower surface).

Therefore the work done per unit area increases the surface energy () is given by;

²² free surface energy surface tension

Alternative definition of

Is the work done per unit area in increasing the surface area of a liquid under isothermal conditions.

Example

Calculate the work done against surface tension force on blowing a soap bubble of diameter

15mm , if the surface tension of the soap solution is $3.0x10_{-2}Nm_{-1}$.

Solution

Work done increase in

increase in surface area (24π)

3.0 2.4 _ (_____)

Work done 4.241 1 J

Increases in surface area is multiplied by 2 for both the upper and lower surface of a soap bubble.

Calculate the change in surface energy of a soap bubble when its radius decreases from 5cm to

1cm, given that the surface tension of soap solution is

Solution

| Work done | increase in | n surface a | rea | (24m) | | |
|------------------|-------------|-------------|-----|-------|-----------|---|

EXERCISE: 33

A spherical drop of mercury of radius 2mm falls to the ground and breaks into 10smaller drops of equal size. Calculate the amount of work that has to be done.

(Surface tension of mercury = $4.72 \times 10_{-1} \text{ Nm}_{-1}$) **An**[2.74x10-5J]

Relationship between surface area and shape of a drop

The area of a liquid has the least number of molecules in it under surface tensional forces. Surface are of a given volume of a liquid is there minimum when its is spherical and this explains why the meniscus and small droplets of mercury and rain are spherical in shape.

Why small mercury droplets are spherical and larger one flatten out

A small drop takes on a spherical shape to minimize the surface energy which tends to be greater than the gravitational potential energy. Therefore, the gravitational potential force cannot distort the spherical shape due to the very small mass of tiny droplets.

A large drop flattens out in order to minimize the gravitational potential energy, which tends to exceed the surface energy. Due to its large weight, gravitational force distorts the spherical shape of large

drops. The shape of the drop must agree with the principle that the sum of gravitational potential energy and surface energy must be a minimum

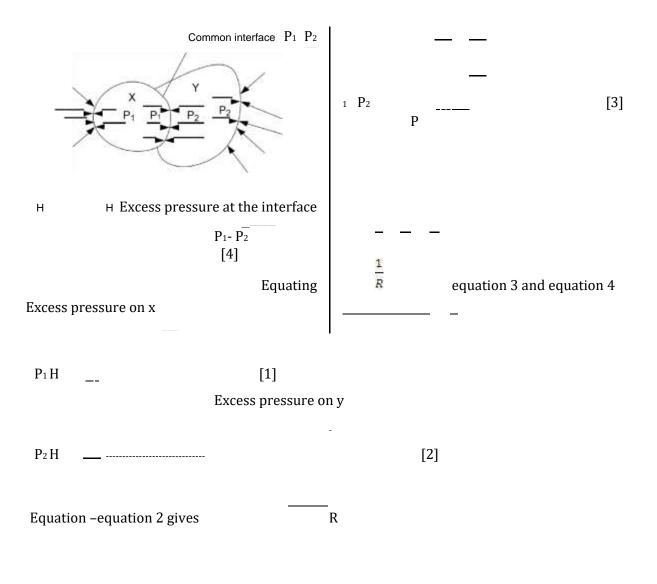

COMBINED BUBBLES

CASE 1

A soap bubble x of radius r₁, and another bubble y of radius r₂, are brought together so that the combined bubble has a common interface of radius R. show that

R _____

Solution

Example

A soap bubble x of radius 0.03m and another bubble y on radius,0.04m are brought together so that the combined bubble has a common interface of radius r. calculate r

Solution

Using r _____ 0.12m

Two soaps bubble A and B of radii 6cm and 10cm respectively coalesce so that the combined bubble has a common interface . calculate the radius of curvature of this common surface and hence the pressure difference. Given that surface tension of soap is

Solution

0.15m Using r

pressure difference

CASE 2

Two bubbles of a soap solution of radii r1 and r2 of surface tension and pressure P coalence under isothermal conditions to form one bubble. Find the expression for the radius of the bubble formed.

Solution

Let R be the radius of the new bubble A₂ be A1 be the surface area of bubble with radius r1 A be the surface area of bubble with radius R

the surface area of bubble with radius r₂

Under isothermal conditions, work done in enlarging the surface area of a bubble is given by

2A 2A1+2A2 24π 24π

Examples

Two soap bubbles have radii of 3cm and 4cm, the bubbles are in a vacuum and they combine to form a single larger bubble. Calculate the radius of this bubble

Solution

Two soap bubbles of radii 2cm and 4cm respectively coalesce under isothermal conditions. If the surface tension of the soap solution is

 $\sqrt{}$

Solution _____√(____) (___) √ pressure difference

EXERCISE: 34

A soap bubble whose radius is 12mm becomes attracted to one of radius 20mm. Calculate the radius of curvature of the common interface. **An**[**30mm**]

Two soap bubbles of radii 2.0cm and 4.0cm respectively coalesce under isothermal conditions. If the surface tension of the soap solution is 2.5x10₋₂Nm₋₁. Calculate the excess pressure inside the resulting soap bubble. **An[2.36Pa]**
